ABSTRACT

This study aimed to identify the support network especially family support system of visually challenged women. Women with visually challenged is one of the greatest a significant social issue globally. The family support as an informal network that provides individuals, with expressions of emotional concern or empathy. The descriptive nature of this study was undertaken with the objectives of the family support network of visually challenged women in Tiruchirappalli city, Tamil Nadu. The sample of 42 visually impairment women aged 24 and above 44 years of age were selected through purposive sampling technique. An interview schedule and observation was used for collection of data. 83.3% of visually challenged women have received good emotional support from their family. Almost maximum number of women with visual impairment got good personal support like the household task, cleaning, handling money, support during pregnancy period, care of children etc. The study has shown that having good family support is a strong protective factor against negative things such as depression, isolation, poverty and helps to increase well-being.

Keywords: visually challenged, family support, socio-economic condition

INTRODUCTION

Visually challenged people are in many parts of the world. They face a lot of problems in their life and they have to depend on others for satisfying their needs. The visually challenged, those who are either blind or have low vision, have a reduced ability to perform many tasks which are considered trivial to the sighted. They are often alienated from mainstream society because of their inability to interact in what many would consider a “normal way.” Visually challenged leads to social isolation and unequal opportunities. Women with visually challenged is one of the greatest a significant social issue globally. According to World Health Organization,(2016), estimated that there are more than 600 million people with disability in the world, this represents 20% of the world’s population. Among them, 285 million people are visually impaired in the world (exist among certain age, sex, socio-demographic, racial, and geographic subgroups.) from all causes; of these, 39 million blind across the globe who are blind 246 million having low vision. As per the Census 2011 show the Indian scenario of visual impairment is over 45 million people are still from India (15 million blind), in which 80 percent of them live in remote and isolated villages.

The family support as an informal network that provides individuals, with expressions of emotional concern or empathy. Family support means the support of family during a crisis has long been seen to have a positive emotional effect on people. Family support of visually challenged women is considered the most significant factor to lead their day to day activities and maintain the emotional balance. Many studies also show that family may have a positive impact on their life and it is reducing emotional conflict. Family is the most precious social institution in India and the most vital non-formal social security...
for the visually challenged women. In recent years
Indian society is experiencing a gradual but definite
change in the traditional and conventional family
system. These changes have notable implications on
the status and support of visually challenged women.
Thus a study on family support of visually challenged
is necessary for analyzing the existing structure of
family support and the nature and extent of family
relations.

SIGNIFICANCE OF THE STUDY
Around the world, women make up just over 51% of
the population. Women with visually challenged do
not form a homogeneous group. They are multiplying
disadvantaged by their status as women, and majority
numbers of Indian visually impaired women are living
in poverty. Women with visually challenged are the
most marginalized in India. In addition, they are
exposed to social stigma and stereotyping within their
community, which leads them to feel devalued,
isolated, and ashamed. Visual impairment brings
profound economic disadvantage to individuals, their
families and societies.

Several recent studies have quantified these impacts.
Many of the causes of avoidable blindness in low-
income countries are directly related to poverty,
including hunger, malnutrition and limited access to
health, education, water and sanitation services. These
problems are most acute in the least economically
developed regions. Impairment is very specific and
individual to that person alone touches every aspect of
that individual’s life experience, manifesting itself in
physical, emotional, psychological, environmental,
educational, social, spiritual and financial dimensions.
There are many types, causes and images of disability
and they face many barriers, including separation,
segregation, stereotyping, labeling, prejudice and
stigma. Misunderstood or inappropriate terminology,
barriers to communication and information, and
inaccessible environments also make disabled
people’s lives unnecessarily difficult. In this study
family support system of visually challenged women
are basically three levels that are emotional support,
financial support, and personal support. Women with
visual impairment, depends to a great extent on the
support the person gets from her family members.

REVIEW OF LITERATURE
Fauzia Khurshid et.al (2011) examined a study on the
perception of visually impaired about familial, academic and caregivers support. The study targeted
to explore the difference in the perception of support
of visually impaired youth living in the residential
institute. A questionnaire consisting of 28 items
developed through standardizes procedure and used
for data collection. The sample of the study was
involved of 100 students. Among them 58 were boys
and 42 were girls, ages ranged from 15 to 22 years,
they belong to different socioeconomic status. The
result of the study revealed that the performance and
attitude of caregivers are not satisfactory; moreover,
residential facilities are also not enough.

Lola Marson (2003) conducted a study on the impact
of the rehabilitation programme offered by the
agencies of the Caribbean Council for the Blind on
the status of blind and visually impaired women in
the region. The sample consisted of 100 blind and
visually impaired women from four Caribbean
islands, namely, Barbados, Jamaica, St. Lucia and
Trinidad. The method of data collection used was
questionnaires which, consisted of thirty-nine
questions incorporating five major variables. The
findings revealed that the impact of the programme
was positive in the areas of independent travel,
decision-making in the home, the performance of
household duties and on self-confidence.

Clare Thetford et.al (2011) conducted study on long-
term access to support for people with sight loss. Data
from biographical interviews with 36 participants with
sight loss is presented, with the particular focus on
three illustrative case studies. The study reveals that
many participants experienced problems gaining
information about, and access to, services in the short
and longer term. There is a need for the systematic
referral of clinical services to social and voluntary
services and for the regular follow-up to identify and
respond to people’s changing needs.

Suzanne Hodge et.al (2013) conducted on exploring
the role of an emotional support and counseling
service for people with visual impairments. There was
growing evidence of the need for services to address
the emotional support needs of people with visual
impairments. Findings from a mixed methods
evaluation of an emotional support and counseling
service delivered within an integrated low vision
service, focusing primarily on the qualitative findings.
Data collected using a standardized measure of
psychological well-being show an improvement in the
psychological well-being of clients of the service
between baseline and follow-up assessment. Qualitative findings from interviews with service
users and service providers help to illustrate and
explain the experiences underlying the quantitative

findings. The services are shown to be helpful to service users in two particular ways: helping them to normalize their experiences by talking to an impartial listener and helping them to accept and adapt to the physical, emotional and social changes in their lives resulting from their visual impairment.

The paper arises from research funded by the Housing Corporation and Thomas Pocklington Trust, which investigated the housing and support needs and priorities of visually impaired people of working age, a population that has received little public policy attention. It reports on an in-depth study of the circumstances and aspirations of 121 people living in London, which revealed a need for increased opportunities to access information, personal support, employment, and housing. The study also discovered strategies that this sample believed would address such need, including better professional collaboration and training, consultation and partnership, and facilitative housing provision (John Percival and Julienne Hanson, 2007).

METHODOLOGY
The descriptive nature of this study was undertaken with the objectives of family support system of visually challenged women in Tiruchirappalli, Tamil Nadu. The sample of 42 visually impairment women aged 24 and above 44 year of age were selected through purposive sampling technique. An interview schedule and observation was used for collection of data.

Source: Primary Data

The data reveals that majority in the age group of 35-39 years and more than 70% of them were housewives. They recorded a monthly family income ranging from Rs. 2000 to Rs. 5,500, moreover they come under the lower income group because they do not have equal opportunity to participate in ever work and excluded from main stream of the society. Majority of them reported disability condition of spouses was blind (69%) and 14.3% of spouse of visually challenged women has other type of disability like deafness.

Source: Primary Data
The data reveals that family support is included three sub items such as emotional support, financial support, personal support 83.3% of respondents have received good emotional support from their family. Maximum number of women got positive emotional support from their parents, siblings, spouse, children and any other close relative. The family has provided good support in time of their ill health and cared them well. Nevertheless, compare to three support system (Emotional support, financial support, Personal Support) women with visual impairment have less financial support than other two support system reason for that family of women with visual impairment also facing the condition of poverty, unemployment, underemployment etc. Hence family members could not support them financially.

CONCLUSION

There are many problems for visually challenged women in society, they face many type of hurdles in performing every day routine works and encounter embarrassment many times while performing the tasks, to highlight very specifically, when they are unsuccessful in performing or completing them. Families are society’s most important building block and strong families equate to strong communities because they embody caring for others, connectedness with people, and providing hope, support and comfort. The study has shown that having good family support a strong protective factor against negative things such as depression, isolation, poverty and helps to increase well-being. Women with visually challenged have good family support even though financial help of family was less than other kind of family support.
