#### ABSTRACT

In Tamil Nadu, infrastructure development has increased the growth of the state economy and has generated large amount of job opportunities. Hence those projects involve a large amount of investment to carry out. In view of that, if any sort of impact of culture would lead to waste of resources and delay of construction. In this connection, this study mainly discusses the critical cultural factors and its assessment techniques through comparative study of construction projects across Tamil Nadu by using questionnaire survey which would reveal the strong correlation between the culture followed in project and the outcome of the project. About 30 relevant articles published over the last 20 years have been reviewed. The review resulted that a simple assessment technique will be developed for each project task to assess the impact of culture in construction project easily and quickly, which will encourage the practitioners to do the cultural analysis in their project. This study concluded that the earlier cultural identification in the project assessment of the construction will lead to the better estimation of the escalation on time overrun. Such cultural assessments help to successful completion of the project.

*Keywords: Tamil Nadu Construction Projects, Culture, Performance* 

#### I. INTRODUCTION

#### A. Culture in Construction Project

In undertaking any research, it is necessary to initially establish the need for such study. By doing so, a point of reference is provided against which the outcomes of the study can be assessed. This is the intention of this study in which the context is set, and the aim and objectives are defined.

The aim of this paper is to determine the extent to which the Tamil Nadu construction project performance influences organizational culture and to develop a model to assess construction project / organizations in terms of performance, and to their possible outcomes of cultural orientation.

To achieve the above, the study would seek to:

- Review the literature based on performance of understanding the factors influencing the role of culture in Tamil Nadu.
- Trace the evolution of 'culture' based on project culture in Tamil Nadu.
- Develop a relationship model between performance and organizational culture.
- 4. Develop an instrument for diagnosing and measuring organizational cultures in Tamil Nadu.
- 5. To assess the performance of organizational culture in Tamil Nadu.

# Figure 1. Four Dimension of Culture (Hofstede, 1993)

Figure 1, depicts the four dimension of culture as described by Hofstede, (1993). These are said to be of great importance when considering the effect of cultural differences on management and organizations. According to Fuber, Smith and Crapper (2012) this model is highly influential and has been widely used to predict how a group of people from a certain cultural background will react in a given scenario.

Hofstede's dimensions of culture are described by Amponsah (2012) as:

- Individualism vs Collective the Individualism dimension is dealing more on the individual person and how self-centred and selfish they are, because they are not tied to anyone in society. The collectivism dimension is the opposite of individualism. In this society the individuals are strongly tied to people in their society. Nonetheless, "it appears that an individualistic country is wealthier than a collectivist country".
- *Power Distance* this dimension is more focused on the degree of inequality found in a country. In an organization context it refers to the degree of centralized authority.
- Uncertainty Avoidance in this dimension, as the name speaks for itself, the degree of uncertainty and anxiety about the future is measured in a society. The weaker this measure is it means the more secure the people of that society are and vice versa.
- *Masculinity Vs Femininity* this dimension deals more with the role that men and women play in society, the divisions caused by these

sex roles and how important it is that these roles are clearly defined. The more defined these roles are in a society, the more "masculine" that society is, whereas the society with less defined roles is "feminine".

# II. History of Impact of Culture in Construction Projects

#### A.The 1990's–Origin of Cultural Analysis in Construction Industry

During 1990s Culture in construction became a hot research topic. Many researchers developed a series of thumb rule to analyze and assess culture in construction. (Al-Bahar, 1988)

The culture in construction project can be managed by a systematic approach during planning stage in order to minimize their effects. This approach involves identifying sources of culture and its impact on construction project and selecting ways to control them. (Birinie and Yates, 1991). Accordingly, the impact of culture in construction were categorized based on controllable and uncontrollable factors which lead cost and time overrun in a project (Akinel, 1998). Based on this result, different cultural assessment models have been formulated to analyze and assess impact of culture in project during construction (Mustafa and Bahar 1991).

## B. The New Systematic Approaches

Till 2000, only few attempts have made on the identification and assessment of impact of culture in construction projects. As a result there was a lack of systematic approaches to identify and manage the culture in construction projects. Chapman, (2001) grouped culture into three subdivisions: industry, client and projects. Shen, (2001) categorized them into four groups with the nature of the culture in construction projects i.e legal, management, policy and political. Chen et al., (2004) proposed 10 cultural factors affecting construction project and they were grouped under two factors such as, management factors and parent factors. Dikmen et al., (2007) used cultural influence diagrams to define the factors which have influence on construction projects. In the post 2000's many researchers made an attempt to propose the impact of culture in construction project using assessment tools such as Analytical hierarchy process (AHP).

#### C. The Post 2011's – Development of More Sophisticated Techniques

There is a sharp increase in the number of cultural assessment papers published after 2011. By many researchers, various integrated approach is developed analyzing the cultural assessment for in comprehensive decision making frame work. Rezakhani (2012) classified the cultural factors under three heads: External, Legal and internal. External sub divided into cultural was two subsets: unpredictable/ predictable/ uncontrollable, uncontrollable and Internal cultural factor was sub divided into two subsets: Non- technical / controllable and Technical / controllable. Further he suggested a hierarchy based cultural analysis and identified the key cultural factors Goh et al (2013) identified various cultural factors in the life cycle of the project under five heads such as Planning, Design, Procurement, construction, and Handling. They discussed the cultural impact with an integrated approach which includes brain storming, checklist, probability impact matrices, and subjective judgment. Finally they suggested that the cultural assessment workshop will be useful for cultural identification and analysis, as a means of managing culture. Many researchers have tried various approaches for representing the interdependencies between project culture and its complexity of the surrounding environment (Lazzerini and Mkrtchyan, 2011). (Hwang et al., 2013) reported that impact of culture in construction project is relatively high in large construction projects and this is due to time and budget and high profit margin. The results indicated a positive connection between cultural assessment/ analysis implementation and improvement in project quality, cost and schedule performance of large projects.

#### III. Analysis and Discussion on Identification and Assessment of Cultural Factors

# A. Different Types of Culture in Construction Projects

Culture in construction has been classified in different ways. Tah *et al.* (1993) categorized project culture into external and internal risks and developed a fuzzy model for analyzing cultural impact. External cultures are those that are prevalent in the external environment of projects. Internal culture covers labor and subcontractor. Consequently many researchers identified several cultural factors and they are classified into different types depends on nature of the project. (Mustafa, 1991; Akincl et al., 1998; Prasanta kumar dey, 2002; Ghosh et al., 2004; Wiguna and scott, 2005; Enshasi and mosa, 2008; wang et al., 2010; Razakhani, 2012; Goh et al., 2013).

#### **B.** Methods for Analyzing Culture in Tamil Nadu

Principally two research methods are adopted across Tamil Nadu namely In-Depth interview method and Computation method. The In-Depth interview method has Limitation in its application. The Computation method is termed to be reliable and allows data collection to large spectrum of organization. In most instances Computation method is achieved by collecting data through the use of questionnaire.

The current study adopted the Computation method and hence questionnaire survey was used to collect data. The Computation

Method is preferred than In-Depth interview method since it was important that respondent answered to the same questions that were prepared before. Firstly a Preliminary Survey was conducted across Tamil Nadu to assist with developing the main questionnaire survey. The concept was to ensure questionnaire questions were absolute to yield desired outcome.

Respondents to the preliminary study gave suggestions that to be included in the main survey and the analysis indicated certain changes to the questionnaire were necessary to be more reliable. The main questionnaire was conducted in the second stage of data collection. Respondents were requested to answer on a five-point Likert scale. Respondents were requested to rate to which they agree or disagree based on their project performance. Each of the scaling given a percentage to show the weightage of each answer.

# Table 1: Likert Scale used for drafting theQuestionnaire

Scale	Description	Percentage Allogation(%)
5	Strongly Agree	80-100
4	Agree	50-80
3	Neutral	50
2	Disagree	20-50
1	Strongly Disagree	0-20

#### IV. Case Study: Tamil Nadu Construction Projects

#### A. Data Collection

The impact of cultural factors identified by many researches done in 4 different projects in Tamil Nadu (2 in Chennai, 1 in Nilgiris and 1 in Nagercoil) by drafting Questionnaire using the Appendix (Section A and Section B) as shown below. From the demographic information it is understood that, factors Respondents age, Respondents like gender. Respondents qualification, Respondent experience, Respondents organization category, Respondent role in the project (Foreman, Construction Manager, Engineer, Project Engineer, Project Manager. Engineering Manager etc) are the critical cultural factors in any construction projects.

# Table 2: Companies visited for CollectingQuestionnaire

From the Appendix (Section A and Section B) it is concluded that, there is an urge for a cultural flowchart map which depicts the sources of critical cultural factors and its impact on the construction project. Accordingly a cultural flowchart map has been developed and it is discussed below.

#### **B.** Cultural Flowchart Map

From the review of literature, the major Cultural analysis and their impact are identified. The cultural flowchart map representing the cultural sources affecting the project success is shown in figure 2. This flow chart consists of various cultural factors, which are forecasted or inevitable. The evitable factors should be forecasted during the earlier stage of the project whereas the inevitable factors involve uncertainties; this should also be estimated for the successful completion of the project because these cultural factors will affect the cost, time, quality of the project.

SI.No	Name of the Company	Address	Place	Sources of culture in
1.	Priyadarshini Construction	No 3G/1, Kanagar Street, Tiruvottiyur, Chennai - 600019, Opposite Agathiyar Madam & Ambal Tower	Chennai Frend in Resea Develo	Culture Construction
2.	Raja Rajan Construction	No 15, 2nd Main Road , NGO Colony, Adambakkam, Chennai - 600088, Near NGO Colony Bus Depot, NGO Colony	Chennai	Client Culture, Project Members Culture, Contractor Culture
3.	Dream House Construction	No 90/1, Bank Colony, Coonoor Road, Nondimedu, Ooty - 643001	Nilgiris (Ooty)	Impact leads to overrun
4.	Abinaya Construction	No 51, Court Road, Nagercoil - 629001, Opposite SLB School	Nagercoil	Affect the Project Success Figure No.2 Cultural Flow Chart Map representing

**Figure No.2** Cultural Flow Chart Map representing the cultural sources affecting the project success

#### **C. Demographic Information**

Information on the profile of respondents in terms of age, gender, race, ethnicity, educational background and organizational category is presented in this section.

The respondent's age distribution is shown in Figure 3. The findings show that almost 2% of the respondents were between the age of 18 and 24 years. This group also had the lowest responses. The low responses from the mentioned group could be that questionnaires were sent mainly to project and engineering managers. Most 18 to 24 year olds would normally not be in that category of professionals who were requested to participate in the study. The majority of respondents constituting 45.4% of all respondents were between the age of 25 and 34 years. This finding was not surprising as most of the respondents were recruited from networks and contacts that had been formed by the researcher, whose age also falls within this group. In addition, it could be because the respondents found the topic to be interesting and therefore were keen to respond to the questionnaire.

Figure 3: Respondent's Age Profile

In terms of the gender profile, findings show that there were more males and than females (Figure 4) who took part in the study, accounting for about 88% of the respondents. Women contributed about 12% of the respondents. This finding was not surprising because the construction industry is said to be dominated by males. The other reason for this low participation from the females could be that not enough women received the questionnaires, which is in a way as a result of few women being involved in construction projects, and hence and lack of interaction.

The Respondents were also required to indicate their highest level of education, and these qualification distributions are shown in Figure 5 below. The figure shows that about 1.9% of the respondents had a Matric certificate, with the majority, over 90% of junior and senior management in the construction industry having a qualification higher than Matric. Most of the respondents had a post-graduate qualification accounting for 50.5%, while 37.4% of the respondents had an undergraduate qualification. The current study benefited from the unique feature of having respondents with such varying backgrounds and hence assuring and reliability of the study.

#### Figure 5: Respondent's Highest Qualification

In Figure 6 below, the respondents' experience in the construction industry is depicted. Respondents having between 6 and 10 years of experience accounted for 23.1% followed by those having between 11 to 20 years of experience. This category accounted for 25.9%. Finally, respondents having more than 20 years of experience accounted for 28.7%.

In this study, it was important to establish which sectors of the built environment the respondents represented. As shown in Figure 7, 51% of the respondents worked for consulting firms. The client organizations contributed about 30% and the contracting organizations contributed 18%, with the remainder 1% indicating 'other'.

The majority of the respondents were engineers accounting for 33.3% (Figure 8), 19.4% were project managers. 13.9% were engineering managers and 13% were project engineers. Only 6.5% were categorized as construction managers.

Figure 7: Respondent's company (organization) category

Figure 8: Respondent's Position in the Project

#### V. Summary

This paper reviewed the study on culture in construction project both in a general and in a construction context. Generally, the culture within one construction project influences the behavior of the participants and also the performance of the project/organization. Although there is no clear definition of Project culture, it is generally accepted that an appropriate project culture (e.g. positive, strong, Co-operative, and collaborative) should be developed and maintained within each project environment for in order to promote improvement and performance of a project/organization. At the same time, 'Lean Thinking' is recognized as a catalyst to promote cultural change and to create a positive project culture by facilitating participants to focus on satisfying client's requirements at the project level. By suggesting a modification of a well-established and well-recognized organizational culture model, this paper proposes a clear definition and a conceptual framework for project culture in the construction context.

#### Conclusion

The questionnaire survey from the four construction companies in Tamil Nadu is collected which reveals that statistically that there is 'strong correlation between the project culture and the project outcomes from the Construction industry practitioners' perspective. It is clear the practitioners focus on the process of the project as well as on the outcomes. However, the findings will show that the affordability of developing an appropriate project culture is a major concern of industry practitioners. The incorporation of objective measures (e.g. key performance indicators) will help to validate the performance evaluation. A wider survey from more areas will be helpful to further validate the findings. In addition, it would be beneficial to have more in-depth interviews of parties other than contractors to further establish the nature of culture at the project level and its impacts on the project outcomes.
