Library Clerk, CSIBER, Kolhapur, Maharashtra, India

ABSTRACT
This paper gives the information about resource sharing and network system which is useful in the library daily work. Now days in era of the ICT, the computers make very much impact on every area in our daily life. Library is also not an objection from that. Information explosion is so huge in all area of studies. On the basis of that all / each and every library cannot have that much space and money to store all the information available everywhere. As per the ICT development growth, the libraries have to cope up with the new ideas and techniques available. Resource sharing is the best solution for use of information available in a huge amount. Again the resource sharing is supported by networking in libraries. With the help of networked system, libraries can share knowledge, equipment etc. on online basis. Library material is available in print and digital format which is used by different users as per their needs. Resource sharing and networking is taking a very supportive role in all the areas of library work. On the other hand, libraries can improve their services, performance, and operations related to user’s area of studies.

KEYWORD: Resource Sharing, Objectives of Resource sharing, Networking, INFLIBNET, DELNET

INTRODUCTION
In the era of ICT, the information is available in a digital format such as audio, video, text file etc. Resource sharing is based on co-operation principles which help in storing, accessing information in different areas of studies. ‘Five Laws of Library Science’ the book written by Dr. S. R. Ranganathan has also highlighted about resource sharing and networking of library material and information on library co-operation. Networking and resource sharing is supporting in usefulness and betterment of library services and operations. Five laws of library science play an important role in daily work of libraries. University Grand Commission (UGC) and other educational bodies also suggest and support for the networking of college libraries for resource sharing in India. In Developing countries like India networking of college libraries under umbrella of universities has been widely supported in different levels of development as per ICT requirements tools and techniques. INFLIBNET and NAAC are also highlighted / stressed on networking of university and college libraries in providing information environment of affiliated institutions. There is growth in the information in published document in a recent era in both print and digital form. As a result of this, no any single library can able to get hold of process to store all document that user need as per his subject. “It is difficult to any single library to get your hands on even one percent of the total document published in the world” (Kent 1978).

Some of the reasons for the requirement of resource sharing and networking are as follows:

a) Information Explosion
b) Increase in literature in both print and digital format
c) Wide range of users in all areas
d) Different areas of specialization
e) Declining funds
f) Cost per publication
g) Variety of needs for literature
h) Required environment for ICT – Limitations for libraries
Interlibrary Loan (ILL) is the initial activity in libraries and information centers to support resource sharing. At the local level union catalogue is used as support to resource sharing. In this case only books and library material is taken into concern. Resource sharing is now taken place by library networks as the ICT application used by libraries. The libraries are located on far places from each other the computer networks are used to connect them and communication technology is used for resource sharing. Thus ICT plays an important role in betterment of resource sharing universally. WWW and internet technology added benefits to networking. Different organizations share the access to E-resources by developing consortium and economic knowledge base in limited funds.

RESOURCE SHARING:
According to John Fetter man, “any and all of the materials, functions, and services which constitute a modern library system, it is amalgamation of people (manpower), processes, ideas, materials, and money which form the substance of a library and can be described as its resources”.

The American Library Association (ALA) Seminar on Network and Multi-type Library Co-operation defines the term resource sharing as “The co-operative structures, which cross jurisdictional, institutional, and often political boundaries to join in a common enterprise, several types of libraries — academic, special, and public”.

Since 1960, library professionals are using the term resource sharing. Resource sharing can be supported libraries such as co-operative acquisition, cataloguing, classification. Computerized systems overcome limitations such as distance, language, time etc. two way co-operation is needed from the participating libraries in resource sharing and networked process such as developing the collection on shared basis.

Now a day users are more demanding and their expectation from the libraries are above the collection. For satisfying the user needs as their requirement staff have to be more interactive with the latest knowledge and updates related new areas of interest and requirements in best possible way.

OBJECTIVES OF RESOURCE SHARING:
The main objective of resource sharing is maximum services at minimum cost and creating such an environment that serves to meet all needs of user in available materials. Material means reading material of all types, formats acquisition, cataloguing, storage and preservation. Following are the objectives for better sharing:

a) To give best services to user  
b) To serve with more coverage and facilities  
c) To avoid duplication  
d) To share experiences  
e) To face financial crisis  
f) To encourage interaction  
g) To give wider access to users  
h) To improve ILL productivity and control ILL cost  
i) To offer high quality library and information support services  
j) To reduce communication gap between the libraries

In the management institution following areas for resource sharing such as collection update, inter library loan, reference services, membership, content page services, centralized processing, human resources, expertise and facilities, database creation, union catalogue, training and software.

NETWORKING IN LIBRARIES:
Networking is a process that fosters the exchange of information and ideas among individuals or groups that share a common interest. It may be for social or business purposes. Professionals connect their business network through a series of symbolic ties and contacts.

A network connects computers, mobile phones, peripherals, and even IoT devices. Switches, routers, and wireless access points are the essential networking basics. Through them, devices connected to your network can communicate with one another and with other networks.
Information and library network (INFLIBNET): This is autonomous Inter University Center (IUC) of University Grand Commission (UGC) of India under Ministry of HRD in June 1996. INFLIBNET is involved in modernizing university libraries in India and connecting them as well as information centers in the country through a nationwide high speed data network using the state-of-art technologies for the optimum utilization of information. INFLIBNET is set out to be a major player in promoting scholarly communication among academicians and researchers in India. It gives support to the academic and research institution in automation of libraries, creating union catalogue of serials, thesis, books, monographs, creating database of projects.

Developing Library Network (DELMET): In 1988, DENET was started with financial support by National Information System in Science and Technology (NISSAT). National Information Center (NIC) of the planning commission, Government of India presently supports activities of DELNET. DELNET gives membership to various libraries including universities, colleges, government department and provide technical assistance to them for creating and maintaining bibliographic databases, serials, union catalogue preparation, abstracting services, inter library loan etc.

Management Library Network (MANLIBNET), Ahmadabad Library Network (ADINET), National Information Center Network (NICNET), INDONET, Education and Research Network (ERNET), Calcutta Library Network (CALIBNET) etc. are the number of library networks available in India to support networks. These networks help in resource sharing, staff training, ILL etc. In this way, ICT development changes the working of the library. The libraries using the automated software help each other to full fill the requirement of the user which is the first priority of the library. As per Dr. S. R. Ranganathan five laws of library science by using the new technologies like resource sharing and networking libraries can satisfy all the five laws such a way that satisfying user need in minimum time and cost.

CONCLUSION:
As the ICT is emerged in the library system, the new technology helps us for faster & accurate work to be done. The main reasons of resource sharing in libraries are information / knowledge explosion, increase in library users, library services, acquisition
problem, economic resources, web based resource sharing. Library network ensure resource sharing manage number of libraries by co-operative nature which help in collection development and reduce duplication of work. The main purpose of library network is to make available network based services to users, document delivery services, bibliographic information services and human resource development.
