ABSTRACT

It was the touch screens which initially created a great outbreak. Gone are the days when you have to fiddle with the touch screens and end grazing up. Touch screen displays are pervasive worldwide. Frequent touching a touchscreen display with a pointing device such as a finger or if there is any scratch caused due to major problems can result in the gradual de-sensitization of the touchscreen to input and can ultimately lead to blip of the touchscreen. To avoid this, a simple user interface for Touchless control of electrically operated equipment is being developed. Elliptic Labs innovative technology lets you control your apparatuses like Computers, MP3 players or mobile phones without touching them. A simple user interface for Touchless control of electrically operated equipment. Unlike other systems which depend on distance to the sensor or sensor selection this system depends on hand and or finger motions, a hand wave in a certain direction, or a rifle of the hand in one area, or holding the hand in one area or pointing with one finger for example. The device is based on optical pattern recognition using a solid state optical matrix sensor with a lens to detect hand motions. This sensor is then connected near to a digital image processor, which interprets the patterns of motion and outputs the results as signals to control fixtures, appliances, machinery, or any device well-regulated concluded electrical signals.

Keywords: Technology, Display, Screen, and Touch

1. INTRODUCTION

The Touch less touch screen sounds resembling it would be nice and easy, however after closer examination it looks like it could be quite a workout. This screen is made by Touchwood, White Electronics Designs, and Group 3D, it works by detecting your hand movements or hand wave in certain directions in front of it.

2. WHAT IS TOUCH SCREEN?

Touch Screen is an important source of input or output device normally layered on top of an electronic visual device.

A user gives the input or control the information processing through single or multi-touch gestures by touching the screen.

It enables the user to interact directly with what is displayed, rather than using any intermediate device.

1.1. How Touch Screens Work?

Touch Screens have made various devices so simpler to use. A simple tap, little swipe and the required task is done.

- **Resistive Touch Screens**

One of the most basic systems mostly used in ATM’s is the resistive touch screen system. It consists of two electrically conductive layers, one of which is resistive and the other one is a conductive layer. These two layers are separated by spacers, which keeps them apart until you touch it. A scratch resistant on top completes the whole setup.

![Fig 1: Front View of Resistive Touch Screen Setup](image1)

![Fig 2: Side View of Resistive Touch Screen Setup](image2)
An electrical current runs through the two layers at all times. When you touch the screen the two layers are pressed together, and the electrical current changes at the point of contact. The change in electrical field and its co-ordinates are calculated by the software, which further carries out function corresponding to that advert.

Although this system is resilient and consistent, they can only handle one touch at a time. That is why high end devices most likely use capacitive touch screens.

- **Capacitive Touch screens**

  ![Fig 3: First process of Capacitive Touch Screen](image1)

In capacitive system, a layer that stores electric charge constructed from materials like copper or indium tin oxide is used. Sensors at corners and defensive sheath complete the whole setup.

A tiny amount of voltage is applied to all corners of the touch screen.

![Fig 4: First process of Capacitive Touch Screen](image2)

So how does it work? Human body can act as a capacitor. That means it can conduct electricity. So when a user touches this screen with his or her finger, some of the charge is transferred to the user. This is sensed at each corner at the screen. The electric current value at each corner will differ according to the touch point. This relative difference aids the software to find exactly where the touch took place, and further it carries out function corresponding to that spot.

IPhone’s, most mid-range to high ends smart phone, tablets and computers use this system.

- **Infrared Touch screens**

  ![Fig 5: Infrared Touch Screen](image3)

It is the less common and less precise one. It consists of LEDs and Light detecting photocells arranged on the opposite sides of the screen. The LEDs shine ultraviolet light in front of the screen – a bit like an invisible spider’s web.

If a user touches the screen at a certain point, the user interrupts two or more beams. This aids the controller to find the exact location of the touch and the corresponding function is carried out. Since the grin is interjected, infrared screens work just as well whether we use finger or stylus or even using it with gloves on.

But in case of capacitive touch screen, with gloves on will not work, since a glove doesn’t conduct electricity. Infrared touch screen are mostly used in Amazon Kindle and Sony eBook readers.

- **Surface Acoustic Wave (SAW) Touch Screen**

  ![Fig 6: Surface Acoustic Wave (SAW) Touch Screen](image4)

Surface acoustic wave detects fingers using sound instead of light. Ultrasonic sounds which are too high pitched for humans to hear are reflected back and forth across its surface. When the screen is touched the user interrupts the sound beam, and the location of the touch is calculated.

3. **WHAT IS TOUCH LESS TOUCH SCREEN?**

Imagine a world you could control with your hands.

It was developed by Elliptic Labs. This system depends on the finger or hand motions, hand wave in certain direction, with this your hand doesn’t have to come in contact with the screen.

It requires a sensor, the sensor can be either placed near the screen or on the table.

Elliptic Labs named it as “Touch Less Human or Machine User Interface for 3D Navigation”.

### 3.1. Wave Flow

![Fig 7: Wave Flow of Touch less Touch Screen](image5)

The system is capable of detecting movements in 3-dimensions without ever having to put your fingers on the screen. Sensors are mounted around the screen, by interacting in the line-of-sight of these sensors the motion is...
detected and interpreted into onscreen movements. The device is based on optical pattern recognition using a solid state optical matrix sensor with a lens to detect hand motions.

This sensor is then connected to a digital image processor, which interprets the patterns of motion and outputs the results as signals toward control software or any device well-regulated through electrical signals. It consists of three infrared lasers which scan a surface. It recognizes the position of an object from as 5 feet.

### 3.1 Gesture Based Graphical User Interface (GBUI)

Leap motion controller is used to translate hand movements into computer commands. Initial tests were conducted to establish how the controller worked and to understand basic interaction. The controller is used to test the recognition of sign language. The finger spelling alphabet was chosen for the relatively ease of individual signs, and for the diverse range of movements involved in the alphabet.

The focus of these tests is to evaluate the capabilities and accuracy of the controller to recognize hand movements.

![GBUI Symbols](image)

There is a particular meaning for different motions or gestures.

#### 4. APPLICATIONS

- **Touch less monitor**
  
  It is specially designed for the applications where touch may be difficult, such as for doctors who might be wearing gloves. The display features capacitive sensors that can read movements from up to 15 – 20 cm away from the screen and the software translates these gestures into commands. The monitor screen is based on technology from Touchwood and was recently demonstrated by White Electronic Designs and Approach Services at the CeBIT show.

- **Touch less UI**
  
  UI in Redmond headquarters and it involves lots of gestures which allow you to take applications and forward them onto others with simple hand movements. So after reading a document, you could just push it off the side of your screen.

- **Touch less SDK**
  
  The Touch less SDK is an open source SDK for .NET application. It enables developers to create multi-touch based applications using webcam for inputs. Color based markers are defined by the user.

- **Touch Wall**
  
  Touch wall refers to the touch screen hardware setup itself; the corresponding software to run Touch Wall, which remains put together on a standard version of Vistas, is called Plexus. Touch Wall and Plexus is superficially similar to Microsoft Surface, a multi-touch computer that was introduced in 2007 and which recently became commercially available in select AT&T stores.

#### 5. MINORITY REPORT INSPIRED TOUCH LESS TECHNOLOGY

Touch less Technology based on gestures instead of clicks and typing may have been an element from a Sci-fi movie in 2002 but it’s no longer science fiction today.

- **Tobias Rex**
  
  Tobias Rex is an eye-tracking device. A Tobias eye tracker is a peripheral device along with software to use it along with the computer and just by putting this with the computer, user will be able to control the computer with his or her eyes. It can be used to zoom in and out, as the user looks where unerringly to zoom. It can be used to select, essentially the eye works as a pointing device and can be used to select the applications. It can also be used to scroll automatically while reading texts. The device has a pair of infrared sensors built in, that will track the user’s eyes.

- **Elliptic Labs**
  
  Elliptic Labs allows the user to operate his or her computer without touching it, a hand wave in certain directions, with the Windows 8 Gesture Suite.

- **Air Writing**
  
  Sensors attached to glove record hand movements, a computer system captures relevant signals and translates them into texts which can then create emails and text messages or any other type.

- **Eye Sight**
  
  Eyesight is a gesture technology which tracks your finger movements and allows you to navigate through your devices by just pointing at it.

- **Point Garb**
  
  Point Grab hand gesture control software that is using the standard 2D camera embedded in the computer, the sophisticated hand shape and motion algorithms are used to determine where the hand is and to perform a whole set of action that allows user to control the windows aids applications and version. This is similar to Eye Sight which can be operated by simply just pointing at the screen.

- **Leap Motion**
  
  Leap Motion is a motion sensor device that recognizes the user’s fingers, so only with the fingers all the motions will be detected with its infrared LEDs and Cameras.
6. ADVANTAGES
- No drivers required.
- No de-sensitization of screen.
- Simple and user friendly.
- Useful for physically handicapped people.
- The touch screen interface can be updated with simple software changes.

7. CONCLUSION
Touch less Technology is still developing. Today’s thoughts are again around user interface. Efforts are being put to better the technology day-in and day-out. The touch less touch screen user interface can be used effectively in computers, cell phones, webcams and laptops. May be few years down the line, our body can be transformed into a virtual mouse, virtual keyboard and what not? Our body may be turned in to an input device.
