# Regularity of Generalized Derivations in P-Semi Simple BCIK-Algebras 

S Rethina Kumar<br>Assistant Professor, Department of Mathematics, Bishop Heber College (Affiliation to Bharathidasan University), Tiruchirappalli, Tamil Nadu, India

#### Abstract

In this paper we study the regularity of inside(or outside) $(\theta ; \varphi)$-derivations in p-semi simple BCIK - algebra X and prove that let $\left.\mathrm{d}_{( } \theta, \phi\right): \mathrm{X} \rightarrow \mathrm{X}$ be an inside $(\theta, \phi)$-derivation of X . If there exists $\mathrm{a} \in \mathrm{X}$ such that $\left.\mathrm{d}_{( } \theta, \phi\right)(\mathrm{x}) * \theta$ (a) $=0$, then $\mathrm{d}_{( } \theta, \phi$ ) is regular for all $\mathrm{x} \in \mathrm{X}$. It is also show that if X is a BCIKalgebra, then every inside(or outside) ( $\theta, \phi$ )-derivation of X is regular. Furthermore the concepts of $\theta$-ideal, $\phi$-ideal and invariant inside (or outside) ( $\theta, \phi$ )-derivation of X are introduced and their related properties are investigated. Finally we obtain the following result: If $\left.\mathrm{d}_{( } \theta, \phi\right): \mathrm{X} \rightarrow \mathrm{X}$ is an outside ( $\theta, \phi$ ) -derivation of X , then $\mathrm{d}_{( } \theta, \phi_{)}$is regular if and only if every $\phi$ ideal of X is $\left.\mathrm{d}_{( } \theta, \phi\right)$-invariant.

KEYWORDS: BCIK-algebra, $p$-semi simple, Derivations, Regularity

## 1. INTRODUCTION

This In 1966, Y. Imai and K. Iseki [1,2] defined BCK - algebra in this notion originated from two different sources: one of them is based on the set theory the other is form the classical and non - classical propositional calculi. In 2021 [6], S Rethina Kumar introduce combination BCK-algebra and BCI-algebra to define BCIK-algebra and its properties and also using Lattices theory to derived the some basic definitions, and they also the idea introduced a regular f derivation in BCIK-algebras. We give the Characterizations f derivation p-semi simple algebra and its properties. In 2021[4], S Rehina Kumar have given the notion of tderivation of BCIK-algebras and studied p-semi simple BCIK—algebras by using the idea of regular t-derivation in BCIK-algebras have extended the results of BCIK-algebra in the same paper they defined and studied the notion of left derivation of BCIK-algebra and investigated some properties of left derivation in p-semi simple BCIK-algebras. In 2021 [7], S Rethina Kumar have defined the notion of Regular left derivation and generalized left derivation determined by a Regular left derivation on p-semi simple BCIK-algebra and discussed some related properties. Also, In 2021 [3,4,5], S Rethina Kumar have introduced the notion of generalized derivation in BCI-algebras and established some results.

The present paper X will denote a BCIK-algebra unless otherwise mentioned. In 2021 [3,4,5,6,7], S Rethina Kumar defined the notion of derivation on BCIK-algebra as follows: A self-map d: $X \rightarrow X$ is called a left-right derivation (briefly on ( $\mathrm{l}, \mathrm{r}$ )-derivation) of X if $\mathrm{d}\left(\mathrm{x}^{*} \mathrm{y}\right)=\mathrm{d}(\mathrm{x})^{*} \mathrm{y} \wedge \mathrm{x}^{*} \mathrm{~d}(\mathrm{y})$ holds for all $x, y \in X$. Similarly, a self-map $d: X \rightarrow X$ is called a
right-left derivation (briefly an (r, l)-derivation) of X if $\mathrm{d}(\mathrm{x}$ * $y)=x^{*} d(y) \wedge d(x) * y$ holds for all $x, y \in X$. Moreover if $d$ is both ( $\mathrm{l}, \mathrm{r}$ )-and ( $\mathrm{r}, \mathrm{l}$ )-derivation, it is a derivation on X . Following [ $3,4,5,6$ ], a self-map $\mathrm{d}_{\mathrm{f}}: \mathrm{X} \rightarrow \mathrm{X}$ is said to be a rightleft f-derivation or an (l, r)-f-derivation or an (l, r)-fderivation of $X$ if it satisfies the identity $d_{f}(x * y)=d_{f}(x)$ * $f(y) \wedge f(x) * d_{f}(y)$ for all $x, y \in X$. Similarly, a self-map $d_{f}: X$ $\rightarrow X$ is said to be a right-left $f$-derivation or an ( $\mathrm{r}, \mathrm{l}$ )-fderivation of $X$ if it satisfies the identity $d_{f}(x * y)=f(x) *$ $d_{f}(y) \wedge d_{f}(x) * f(y)$ for all $x, y \in X$. Moreover, if $d_{f}$ is an $f-$ derivation, where $f$ is an endomorphism. Over the past decade, a number of research papers have been devoted to the study of various kinds of derivations in BCIK-algebras (see for [3,4,5,6,7] where further references can be found).

The purpose of this paper is to study the regularity of inside (or outside) ( $\theta, \phi$ )-derivation in BCIK-algebras X and their useful properties. We prove that let $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right): \mathrm{X} \rightarrow \mathrm{X}$ be an inside $(\theta, \phi)$-derivation of X and if there exists a $\in \mathrm{X}$ such that $\left.\mathrm{d}_{( } \theta, \phi\right)(\mathrm{x})(\mathrm{x})^{*} \theta(\mathrm{a})=0$, then $\mathrm{d}_{( } \theta, \phi_{)}$is regular for all x $\in X$. It is derivation of $X$ is regular. Furthermore, we introduce the concepts of $\theta$-ideal, $\phi$-ideal and invariant inside (or outside) ( $\theta, \phi$ )-derivation of X and investigated their related properties. We also prove that if $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right): \mathrm{X} \rightarrow \mathrm{X}$ is an outside $(\theta, \phi)$-derivation of X , then $\left.\mathrm{d}_{( } \theta, \phi\right)$ is regular if and only if every $\boldsymbol{\theta}$-ideal of X is $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}$-invariant.

## 2. Preliminaries

## Definition 2.1: [5] BCIK algebra

Let X be a non-empty set with a binary operation * and a constant 0 . Then ( $\mathrm{X},{ }^{*}, 0$ ) is called a BCIK Algebra, if it satisfies the following axioms for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{X}$ :
(BCIK-1) $x^{*} y=0, y^{*} x=0, z^{*} x=0$ this imply that $x=y=z$.
(BCIK-2) $\left(\left(x^{*} y\right) *\left(y^{*} z\right)\right)^{*}\left(z^{*} x\right)=0$.
(BCIK-3) $\left(x^{*}\left(x^{*} y\right)\right) * y=0$.
(BCIK-4) $x^{*} x=0, y^{*} y=0, z^{*} z=0$.
(BCIK-5) $0^{*} \mathrm{x}=0,0^{*} \mathrm{y}=0,0^{*} \mathrm{z}=0$.
For all $x, y, z \in X$. An inequality $\leq$ is a partially ordered set on $X$ can be defined $x \leq y$ if and only if
$\left(x^{*} y\right) *\left(y^{*} z\right)=0$.
Properties 2.2: [5] I any BCIK - Algebra X, the following properties hold for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{X}$ :

1. $0 \in X$.
2. $\mathrm{x}^{*} 0=\mathrm{x}$.
3. $x^{*} 0=0$ implies $x=0$.
4. $0^{*}\left(x^{*} y\right)=\left(0^{*} x\right) *\left(0^{*} y\right)$.
5. $X^{*} y=0$ implies $x=y$.
6. $\mathrm{X}^{*}\left(0^{*} \mathrm{y}\right)=\mathrm{y}^{*}\left(0^{*} \mathrm{x}\right)$.
7. $0^{*}\left(0^{*} \mathrm{x}\right)=\mathrm{x}$.
8. $x^{*} y \in X$ and $x \in X$ imply $y \in X$.
9. $\left(x^{*} y\right)^{*} \mathrm{z}=\left(\mathrm{x}^{*} \mathrm{z}\right) * y$
10. $x^{*}\left(x^{*}\left(x^{*} y\right)\right)=x^{*} y$.
11. $\left(x^{*} y\right) *\left(y^{*} z\right)=x^{*} y$.
12. $0 \leq x \leq y$ for all $x, y \in X$.
13. $\mathrm{x} \leq \mathrm{y}$ implies $\mathrm{x}^{*} \mathrm{z} \leq \mathrm{y}^{*} \mathrm{z}$ and $\mathrm{z}^{*} \mathrm{y} \leq \mathrm{z}^{*} \mathrm{x}$.
14. $x^{*} y \leq x$.
15. $x^{*} y \leq z \Leftrightarrow x^{*} z \leq y$ for all $x, y, z \in X$
16. $\mathrm{x}^{*} \mathrm{a}=\mathrm{x}^{*} \mathrm{~b}$ implies $\mathrm{a}=\mathrm{b}$ where a and b are any natural numbers (i. e)., $a, b \in N$
17. $\mathrm{a}^{*} \mathrm{x}=\mathrm{b}^{*} \mathrm{x}$ implies $\mathrm{a}=\mathrm{b}$.
18. $a^{*}\left(a^{*} x\right)=x$.

Definition 2.3: $[4,5,10]$, Let X be a BCIK - algebra. Then, for all $x, y, z \in X$ :

1. X is called a positive implicative BCIK - algebra if ( x *) * $\mathrm{z}=\left(\mathrm{x}^{*} \mathrm{z}\right) *\left(\mathrm{y}^{*} \mathrm{z}\right)$.
2. $X$ is called an implicative BCIK - algebra if $x^{*}\left(y^{*} x\right)=x$.
3. X is called a commutative BCIK - algebra if $\mathrm{x}^{*}\left(\mathrm{x}^{*} \mathrm{y}\right)=$ $y^{*}\left(y^{*} x\right)$.
4. X is called bounded BCIK - algebra, if there exists the greatest element 1 of X , and for any
5. $x \in X, 1^{*} x$ is denoted by $G G_{x}$,
6. X is called involutory BCIK - algebra, if for all $\mathrm{x} \in \mathrm{X}, \mathrm{GG}_{\mathrm{x}}=$ x .

Definition 2.4: [5] Let $X$ be a bounded BCIK-algebra. Then for all $x, y \in X$ :

1. $\mathrm{G} 1=0$ and $\mathrm{G} 0=1$,
2. $\mathrm{GG}_{\mathrm{x}} \leq \mathrm{x}$ that $\mathrm{GG}_{\mathrm{x}}=\mathrm{G}\left(\mathrm{G}_{\mathrm{x}}\right)$,
3. $\mathrm{G}_{\mathrm{x}}{ }^{*} \mathrm{G}_{\mathrm{y}} \leq \mathrm{y}^{*} \mathrm{x}$,
4. $\mathrm{y} \leq \mathrm{x}$ implies $\mathrm{G}_{\mathrm{x}} \leq \mathrm{G}_{\mathrm{y}}$,
5. $\mathrm{G}_{\mathrm{x}^{*} \mathrm{y}}=\mathrm{G}_{\mathrm{y}^{*} \mathrm{x}}$
6. $\mathrm{GGG}_{\mathrm{x}}=\mathrm{G}_{\mathrm{x}}$.

Theorem 2.5: [5] Let $X$ be a bounded BCIK-algebra. Then for any $x, y \in X$, the following hold:

1. X is involutory,
2. $\mathrm{x}^{*} \mathrm{y}=\mathrm{G}_{\mathrm{y}} * \mathrm{G}_{\mathrm{x}}$,
3. $x^{*} G_{y}=y^{*} G_{x}$,
4. $\mathrm{x} \leq \mathrm{G}_{\mathrm{y}}$ implies $\mathrm{y} \leq \mathrm{G}_{\mathrm{x}}$.

Theorem 2.6: [5] Every implicative BCIK-algebra is a commutative and positive implicative BCIK-algebra.

Definition 2.7: [4,5] Let $X$ be a BCIK-algebra. Then:

1. $X$ is said to have bounded commutative, if for any $x, y €$ $X$, the set $A(x, y)=\left\{t \in X: t^{*} x \leq y\right\}$ has the greatest element which is denoted by x oy,
2. ( $\mathrm{X},{ }^{*}, \leq$ ) is called a BCIK-lattices, if $(\mathrm{X}, \leq)$ is a lattice, where $\leq$ is the partial BCIK-order on X , which has been introduced in Definition 2.1.

Definition 2.8: [5] Let $X$ be a BCIK-algebra with bounded commutative. Then for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{X}$ :

1. $y \leq x$ o ( $\left.y^{*} x\right)$,
2. $(\mathrm{x} \circ \mathrm{z})^{*}(\mathrm{y} \circ \mathrm{z}) \leq \mathrm{x}^{*} \mathrm{y}$,
3. $\left(x^{*} y\right) * z=x^{*}(y$ o $z)$,
4. If $x \leq y$, then $x$ o $z \leq y o z$,
5. $z^{*} x \leq y \Leftrightarrow z \leq x$ o $y$.

Theorem 2.9: [4,5] Let X be a BCIK-algebra with condition bounded commutative. Then, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{X}$, the following are equivalent:

1. X is a positive implicative,
2. $\mathrm{x} \leq \mathrm{y}$ implies x o $\mathrm{y}=\mathrm{y}$,
3. $\mathrm{x} 0 \mathrm{x}=\mathrm{x}$,
4. $(x$ o $y) * z=\left(x^{*} z\right) \circ\left(y^{*} z\right)$,
5. x o $\mathrm{y}=\mathrm{x}$ o ( $\left.\mathrm{y}^{*} \mathrm{x}\right)$.

Theorem 2.10: $[4,5]$ Let $X$ be a BCIK-algebra.

1. If X is a finite positive implicative BCIK-algebra with bounded and commutative the ( $\mathrm{X}, \leq$ ) is a distributive lattice,
2. If X is a BCIK-algebra with bounded and commutative, then $X$ is positive implicative if and only if ( $X, \leq$ ) is an upper semi lattice with $x \vee y=x o y$, for any $x, y \in X$,
3. If X is bounded commutative BCIK-algebra, then BCIKlattice ( $\mathrm{X}, \leq$ ) is a distributive lattice, where $\mathrm{x} \wedge \mathrm{y}=$ $y^{*}\left(y^{*} x\right)$ and $x \vee y=G\left(G_{x} \wedge G_{y}\right)$.

Theorem 2.11: [4,5] Let $X$ be an involutory BCIK-algebra, Then the following are equivalent:

1. $(X, \leq)$ is a lower semi lattice,
2. $(X, \leq)$ is an upper semi lattice,
3. $(\mathrm{X}, \leq)$ is a lattice.

Theorem 2.12: [5] Let $X$ be a bounded BCIK-algebra. Then:

1. every commutative BCIK-algebra is an involutory BCIKalgebra.
2. Any implicative BCIK-algebra is a Boolean lattice (a complemented distributive lattice).

Theorem 2.13: [5, 11] Let $X$ be a BCK-algebra, Then, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{X}$, the following are equivalent:

1. X is commutative,
2. $x^{*} y=x^{*}\left(y^{*}\left(y^{*} x\right)\right)$,
3. $x^{*}\left(x^{*} y\right)=y^{*}\left(y^{*}\left(x^{*}\left(x^{*} y\right)\right)\right)$,
4. $x \leq y$ implies $x=y^{*}\left(y^{*} x\right)$.

## 3. Regular Left derivation p-semi simple BCIK-algebra

 Definition 3.1: Let $X$ be a p-semi simple BCIK-algebra. We define addition + as $\mathrm{x}+\mathrm{y}=\mathrm{x}^{*}\left(0^{*} \mathrm{y}\right)$ for all$x, y \in X$. Then ( $X,+$ ) be an abelian group with identity 0 and $x$ $-y=x^{*} y$. Conversely, let ( $\mathrm{X},+$ ) be an abelian group with identity 0 and let $x-y=x^{*} y$. Then $X$ is a $p$-semi simple BCIKalgebra and $x+y=x^{*}(0 * y)$,
for all $x, y \in X$ (see [6]). We denote $x \cdot y=y *(y * x), 0^{*}(0$ * $x)=a_{x}$ and
$L_{p}(X)=\left\{a \in X / x^{*} a=0\right.$ implies $x=a$, for all $\left.x \in X\right\}$.
For any $x \in X . V(a)=\{a \in X / x * a=0\}$ is called the branch of $X$ with respect to a. We have
$x^{*} y € V(a * b)$, whenever $x \in V(a)$ and $y \in V(b)$, for all $x, y €$ $X$ and all $a, b \in L_{p}(X)$, for $0^{*}\left(0^{*} a_{x}\right)=a_{x}$ which implies that $a_{x}$ ${ }^{*} y \in L_{p}(X)$ for all $y \in X$. It is clear that $G(X) \subset L_{p}(X)$ and $x^{*}$ ( $\mathrm{x} * \mathrm{a}$ ) $=\mathrm{a}$ and
$a^{*} x \in L_{p}(X)$, for all $a \in L_{p}(X)$ and all $x \in X$.
Definition 3.2: ([5]) Let $X$ be a BCIK-algebra. By a (l, r)derivation of $X$, we mean a self $d$ of $X$ satisfying the identity $d\left(x^{*} y\right)=(d(x) * y) \wedge(x * d(y))$ for all $x, y \in X$.

If $X$ satisfies the identity
$d(x * y)=(x * d(y)) \wedge(d(x) * y)$ for all $x, y \in X$,
then we say that $d$ is a $(r, l)$-derivation of $X$
Moreover, if $d$ is both a ( $r, l$ )-derivation and ( $r, l$ )-derivation of $X$, we say that $d$ is a derivation of $X$.

Definition 3.3: ([5]) A self-map d of a BCIK-algebra X is said to be regular if $\mathrm{d}(0)=0$.

Definition 3.4: ([5]) Let d be a self-map of a BCIK-algebra X. An ideal $A$ of $X$ is said to be $d$-invariant, if $d(A)=A$.
In this section, we define the left derivations
Definition 3.5: Let $X$ be a BCIK-algebra By a left derivation of $X$, we mean a self-map $D$ of $X$ satisfying
$D(x * y)=(x * D(y)) \wedge(y * D(x))$, for all $x, y \in X$.
Example 3.6: Let $X=\{0,1,2\}$ be a BCIK-algebra with Cayley table defined by

| $*$ | 0 | 1 | 2 |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 2 |
| 1 | 1 | 0 | 2 |
| 2 | 2 | 2 | 0 |

Define a map $\mathrm{D}: \mathrm{X} \rightarrow \mathrm{X}$ by

$$
\mathrm{D}(\mathrm{x})=\left\{\begin{array}{c}
2 i f x=0,1 \\
0 i f x=2
\end{array}\right.
$$

Then it is easily checked that $D$ is a left derivation of $X$.
Proposition 3.7: Let $D$ be a left derivation of a BCIK-algebra
$X$. Then for all $x, y \in X$, we have

1. $x^{*} D(x)=y^{*} D(y)$.
2. $\quad D(x)=a_{D(x)} \cdot x$.
3. $D(x)=D(x) \wedge x$.
4. $\mathrm{D}(\mathrm{x}) \in \mathrm{L}_{\mathrm{p}}(\mathrm{X})$.

## Proof.

(1) Let $x, y \in X$. Then
$D(0)=D\left(x^{*} x\right)=(x * D(x)) \wedge(x * D(x))=x^{*} D(x)$.
Similarly, $D(0)=y^{*} D(y)$. So, $D(x)=y^{*} D(y)$.
2) Let $x \in X$. Then
$\mathrm{D}(\mathrm{x})=\mathrm{D}(\mathrm{x} * 0)$
$=\left(x^{*} D(0)\right) \wedge(0 * D(x))$
$=(0 * D(x)) *((0 * D(x)) *(x * D(0)))$
$\left.\leq 0^{*}\left(0^{*}(x * D(x))\right)\right)$
$=0$ * $\left(0^{*}\left(\mathrm{x}^{*}(\mathrm{x} * \mathrm{D}(\mathrm{x}))\right)\right)$
$=0$ * $\left(0^{*}(\mathrm{D}(\mathrm{x}) \wedge \mathrm{x})\right)$
$=a_{D(x) \cdot x}$.
Thus $D(x) \leq a_{D(x)}$.x. But
$a_{D(x) \cdot x}=0\left(0^{*}(D(x) \wedge x)\right) \leq D(x) \wedge x \leq D(x)$.
Therefore, $D(x)=a_{D(x) \cdot x}$.
(1) Let $x \in X$. Then using (2), we have
$D(x)=a_{D(x)} \cdot x \leq D(x) \wedge x$.
But we know that $\mathrm{D}(\mathrm{x}) \wedge \mathrm{x} \leq \mathrm{D}(\mathrm{x})$, and hence (3) holds.
(2) Since $a_{x} \in L_{p}(X)$, for all $x \in X$, we get $D(x) \in L_{p}(X)$ by (2).

Remark 3.8: Proposition 3.3(4) implies that $D(X)$ is a subset of $L_{p}(X)$.

Proposition 3.9: Let $D$ be a left derivation of a BCIK-algebra $X$. Then for all $x, y \in X$, we have

1. $Y^{*}\left(y^{*} D(x)\right)=D(x)$.
2. $D(x) * y \in L_{p}(X)$.

Proposition 3.10: Let D be a left derivation of a BCIKalgebra of a BCIK-algebra X. Then

1. $\mathrm{D}(0) \in \mathrm{L}_{\mathrm{p}}(\mathrm{X})$.
2. $D(x)=0+D(x)$, for all $x \in X$.
3. $D(x+y)=x+D(y)$, for all $x, y \in L_{p}(X)$.
4. $D(x)=x$, for all $x \in X$ if and only if $D(0)=0$.
5. $D(x) \in G(X)$, for all $x \in G(X)$.

## Proof.

1. Follows by Proposition 3.3(4).
2. Let $x \in X$. From Proposition $3.3(4)$, we get $D(x)=a_{D(x)}$, so we have $\mathrm{D}(\mathrm{x})=\mathrm{a}_{\mathrm{D}(\mathrm{x})}=0^{*}\left(0^{*} \mathrm{D}(\mathrm{x})\right)=0+\mathrm{D}(\mathrm{x})$.
3. Let $x, y \in L_{p}(X)$. Then
$\mathrm{D}(\mathrm{x}+\mathrm{y})=\mathrm{D}(\mathrm{x} *(0$ * y$))$
$=\left(x^{*} D\left(0^{*} y\right)\right) \wedge\left(\left(0^{*} y\right) * D(x)\right)$
$=((0 * y) * D(x)) *\left(\left(\left(0^{*} y\right) * D(x) *(x * D(0 * y))\right)\right.$
$=x$ * $D(0$ * $y)$
$=x^{*}\left(\left(0^{*} D(y)\right) \wedge\left(y^{*} D(0)\right)\right)$
$=x^{*} D(0 * y)$
$=x *(0 * D(y))$
$=x+D(y)$.
4. Let $\mathrm{D}(0)=0$ and $\mathrm{x} \in \mathrm{X}$. Then
$\mathrm{D}(\mathrm{x})=\mathrm{D}(\mathrm{x}) \wedge \mathrm{x}=\mathrm{x}^{*}(\mathrm{x} * \mathrm{D}(\mathrm{x}))=\mathrm{x}^{*} \mathrm{D}(0)=\mathrm{x} * 0=\mathrm{x}$.
Conversely, let $D(x)=x$, for all $x \in X$. So it is clear that $D(0)=$ 0.
5. Let $x \in G(x)$. Then $0^{*}=x$ and so
$\mathrm{D}(\mathrm{x})=\mathrm{D}\left(0^{*} \mathrm{x}\right)$

International Journal of Trend in Scientific Research and Development (IJTSRD) @ www.ijtsrd.com eISSN: 2456-6470
$=(0 * D(x)) \wedge\left(x^{*} D(0)\right)$
$=(x * D(0)) *((x * D(0)) *(0 * D(x))$
$=0 * D(x)$.
This give $D(x) \in G(X)$.
Remark 3.11: Proposition 3.6(4) shows that a regular left derivation of a BCIK-algebra is the identity map. So we have the following:

Proposition 3.12: A regular left derivation of a BCIK-algebra is trivial.

Remark 3.13: Proposition 3.6(5) gives that $\mathrm{D}(\mathrm{x}) \in \mathrm{G}(\mathrm{X}) \subseteq \mathrm{L}$ $\mathrm{p}(\mathrm{X})$.

Definition 3.14: An ideal $A$ of a BCIK-algebra $X$ is said to be D-invariant if $D(A) \subset A$.
Now, Proposition 3.8 helps to prove the following theorem.
Theorem 3.15: Let $D$ be a left derivation of a BCIK-algebra $X$. Then $D$ is regular if and only if ideal of $X$ is $D$-invariant.

## Proof.

Let $D$ be a regular left derivation of a BCIK-algebra X. Then Proposition 3.8. gives that $\mathrm{D}(\mathrm{x})=\mathrm{x}$, for all
$x \in X$. Let $y \in D(A)$, where $A$ is an ideal of $X$. Then $y=D(x)$ for some $x \in A$. Thus
$\mathrm{Y}^{*} \mathrm{x}=\mathrm{D}(\mathrm{x})^{*} \mathrm{x}=\mathrm{x}^{*} \mathrm{x}=0 € \mathrm{~A}$.
Then $y \in A$ and $D(A) \subset A$. Therefore, $A$ is $D$-invariant.
Conversely, let every ideal of $X$ be D-invariant. Then $D(\{0\})$ $\subset\{0\}$ and hence $D(0)$ and $D$ is regular.
Finally, we give a characterization of a left derivation of a psemi simple BCIK-algebra.

Proposition 3.16: Let $D$ be a left derivation of a $p$-semisimple BCIK-algebra. Then the following hold for all $\mathrm{x}, \mathrm{y} \in \mathrm{X}$ :

1. $D\left(x^{*} y\right)=x^{*} D(y)$.
2. $\mathrm{D}(\mathrm{x})^{*} \mathrm{x}=\mathrm{D}(\mathrm{y})^{*} \mathrm{Y}$.
3. $D(x) * x=y * D(y)$.

## Proof.

1. Let $x, y \in X$. Then
$D\left(x^{*} y\right)=\left(x^{*} D(y)\right) \wedge \wedge(y * D(x))=x^{*} D(y)$.
2. We know that
$\left(x^{*} y\right) *(x * D(y)) \leq D(y) * y$ and $\left(y^{*} \mathrm{x}\right) *(\mathrm{y} * \mathrm{D}(\mathrm{x})) \leq \mathrm{D}(\mathrm{x})^{*} \mathrm{x}$.
This means that
$\left.\left(\left(\mathrm{x}^{*} \mathrm{y}\right) *\left(\mathrm{x}^{*} \mathrm{D}(\mathrm{y})\right)\right)\right)^{*}(\mathrm{D}(\mathrm{y}) * \mathrm{y})=0$, and
$\left(\left(y^{*} \mathrm{x}\right) *(\mathrm{y} * \mathrm{D}(\mathrm{x}))\right)^{*}(\mathrm{D}(\mathrm{x}) * \mathrm{x})=0$.
So
$((x * y) *(x * D(y))) *(D(y) * y)=((y * x) *(y * D(x))) *(D(x)$

* x). (I)

Using Proposition 3.3(1), we get,
$\left(x^{*} y\right) * D(x * y)=(y * x) * D(y * x) .(I I)$
By (I), (II) yields
$(x * y) *(x * D(y))=(y * x) *(y * D(x))$.
Since $X$ is a p-semi simple BCIK-algebra. (I) implies that $\mathrm{D}(\mathrm{x}){ }^{*} \mathrm{x}=\mathrm{D}(\mathrm{y}) * \mathrm{y}$.
3. We have, $\mathrm{D}(0)=\mathrm{x} * \mathrm{D}(\mathrm{x})$. From (2), we get $\mathrm{D}(0) * 0=$ $D(y) * y$ or $D(0)=D(y) * y$.
So $D(x) * x=y * D(y)$.

Theorem 3.17: In a p-semi simple BCIK-algebra $X$ a self-map $D$ of $X$ is left derivation if and only if and if it is derivation.

## Proof.

Assume that D is a left derivation of a BCIK-algebra X. First, we show that $D$ is a $(r, l)$-derivation of $X$. Then
$D\left(x^{*} y\right)=x^{*} D(y)$
$=(\mathrm{D}(\mathrm{x}) * \mathrm{y}) *((\mathrm{D}(\mathrm{x}) * \mathrm{Y}) *(\mathrm{x} * \mathrm{D}(\mathrm{y})))$
$=\left(x^{*} D(y)\right) \wedge(D(x) * y)$.
Now, we show that $D$ is a $(r, l)$-derivation of $X$. Then
$\mathrm{D}(\mathrm{x} * \mathrm{Y})=\mathrm{x} * \mathrm{D}(\mathrm{y})$
$=\left(x^{*} 0\right) * D(y)$
$=\left(x^{*}(D(0) * D(0)) * D(y)\right.$
$=\left(x^{*}\left(\left(x^{*} D(x)\right) *(D(y) * y)\right)\right) * D(y)$
$=(x *((x * D(y)) *(D(x) * y))) * D(y)$
$=\left(x^{*} D(y) *((x * D(y)) *(D(x) * Y))\right.$
$=(D(x) * y) \wedge(x * D(y))$.
Therefore, D is a derivation of X .
Conversely, let $D$ be a derivation of $X$. So it is a ( $r, l$ )derivation of $X$. Then
$D\left(x^{*} y\right)=(x * D(y)) \wedge(D(x) * y)$
$=(D(x) * y)^{*}((D(x) * y) *(x * D(y)))$
$=x^{*} D(y)=(y * D(x)) *((y * D(x)) *(x * D(y)))$
$=(x * D(y)) \wedge\left(y^{*} D(x)\right)$.
Hence, $D$ is a left derivation of $X$.

## 4. $\mathbf{t}$-Derivations in BCIK-algebra /p-Semi simple BCIKalgebra

The following definitions introduce the notion of $t$-derivation for a BCIK-algebra.

Definition 4.1: Let $X$ be a BCIK-algebra. Then for $t \in X$, we define a self-map $\mathrm{d}_{\mathrm{t}}: \mathrm{X} \rightarrow \mathrm{X}$ by $\mathrm{d}_{\mathrm{t}}(\mathrm{x})=\mathrm{x} * \mathrm{t}$
for all $\mathrm{x} \in \mathrm{X}$.
Definition 4.2: Let $X$ be a BCIK-algebra. Then for any $t \in X$, a self-map $d_{t}: X \rightarrow X$ is called a left-rifht $t-d e r i v a t i o n ~ o r ~(l, r)-t-$ derivation of $X$ if it satisfies the identity $d_{t}\left(x^{*} Y\right)=\left(d_{t}(x) * y\right)$ $\wedge\left(x^{*} d_{t}(y)\right)$ for all $x, y \in X$.
Definition 4.3: Let $X$ be a BCIK-algebra. Then for any $t \in X$, a self-map $d_{t}: X \rightarrow X$ is called a left-right $t-d e r i v a t i o n ~ o r ~(l, r)-t-$ derivation of $X$ if it satisfies the identity $d_{t}(x * y)=\left(x * d_{t}(y)\right)$ $\wedge\left(\mathrm{d}_{\mathrm{t}}(\mathrm{x})^{*} \mathrm{y}\right)$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{X}$.
Moreover, if $\mathrm{d}_{\mathrm{t}}$ is both a $(\mathrm{l}, \mathrm{r})$ and a $(\mathrm{r}, \mathrm{l})$ - t -derivation on X , we say that $\mathrm{d}_{\mathrm{t}}$ is a t -derivation on X .

Example 4.4: Let $X=\{0,1,2\}$ be a BCIK-algebra with the following Cayley table:

| $*$ | 0 | 1 | 2 |
| :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 2 |
| 1 | 1 | 0 | 2 |
| 2 | 2 | 2 | 0 |

For any $t \in X$, define a self-map $d_{t}: X \rightarrow X$ by $d_{t}(x)=x * t$ for all $x \in X$. Then it is easily checked that $d_{t}$ is a $t$-derivation of $X$.

Proposition 4.5: Let $\mathrm{d}_{\mathrm{t}}$ be a self-map of an associative BCIKalgebra $X$. Then $d_{t}$ is a ( $l, r$ )- $t$-derivation of $X$.
Proof. Let $X$ be an associative BCIK-algebra, then we have
$\mathrm{d}_{\mathrm{t}}(\mathrm{x} * \mathrm{y})=(\mathrm{x} * \mathrm{y})$
$=\left\{x^{*}(\mathrm{y} * \mathrm{t})\right\}^{*} 0$
$=\{\mathrm{x} *(\mathrm{y} * \mathrm{t})\} *[\{\mathrm{x} *(\mathrm{y} * \mathrm{t})\} *\{\mathrm{x} *(\mathrm{y} * \mathrm{t})\}]$
$=\{x *(y * t)\} *[\{x *(y * t)\} *\{(x * y) * t\}]$

International Journal of Trend in Scientific Research and Development (IJTSRD) @ www.ijtsrd.com eISSN: 2456-6470
$=\{\mathrm{x} *(\mathrm{y} * \mathrm{t})\} *[\{\mathrm{x} *(\mathrm{y} * \mathrm{t})\} *\{(\mathrm{x} * \mathrm{t}) * \mathrm{y}\}]$
$=((x * t) * y) \wedge(x *(y * t))$
$=\left(d_{t}(x) * y\right) \wedge\left(x^{*} d_{t}(y)\right)$.
Proposition 4.6: Let $d_{t}$ be a self-map of an associative BCIKalgebra $X$. Then, $d_{t}$ is a $(r, l)-t$-derivation of $X$.
Proof. Let $X$ be an associative BCIK-algebra, then we have $\mathrm{d}_{\mathrm{t}}(\mathrm{x} * \mathrm{y})=(\mathrm{x} * \mathrm{y}) * \mathrm{t}$
$=\{(x * t) * y\}$
$=\{(x * t) * y\} *[\{(x * t) * y\} *\{(x * t) * y)]$
$=\{(x * t) * y\}^{*}\left[\{(x * t) * y\}^{*}\left\{(x * y)^{*} t\right\}\right]$
$=\{(x * t) * y\} *\left[\{(x * t) * y\}^{*}\left\{x^{*}(y * t)\right\}\right]$
$=\left(x^{*}\left(y^{*} t\right)\right) \wedge((x * t) * y)$
$=\left(x^{*} d_{t}(y)\right) \wedge\left(d_{t}(x) * y\right)$
Combining Propositions 4.5 and 4.6 , we get the following Theorem.

Theorem 4.7: Let $d_{t}$ be a self-map of an associative BCIKalgebra $X$. Then, $d_{t}$ is a $t$-derivation of $x$.
Definition 4.8: A self-map $d_{t}$ of a BCIK-algebra $X$ is said to be t -regular if $\mathrm{d}_{\mathrm{t}}(0)=0$.

Example 4.9: Let $\mathrm{X}=\{0, \mathrm{a}, \mathrm{b}\}$ be a BCIK-algebra with the following Cayley table:

| $*$ | 0 | a | b |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | b |
| a | a | 0 | b |
| b | b | b | 0 |

1. For any $t \in X$, define a self-map $d_{t}: X \rightarrow X$ by
$\mathrm{d}_{\mathrm{t}}(\mathrm{x})=\mathrm{x}^{*} \mathrm{t}=\left\{\begin{array}{c}b \text { if } x=0, a \\ 0 \text { if } x=b\end{array}\right.$
Then it is easily checked that $d_{t}$ is ( $\mathrm{l}, \mathrm{r}$ ) and ( $\mathrm{r}, \mathrm{l}$ )- t derivations of X , which is not t -regular.
2. For any $t \in X$, define a self-map d't: $X \rightarrow X$ by $\mathrm{d}_{\mathrm{t}}{ }^{\prime}(\mathrm{x})=\mathrm{x}^{*} \mathrm{t}=0$ if $\mathrm{x}=0, \mathrm{a}, \mathrm{b}$ if $\mathrm{x}=\mathrm{b}$.
Then it is easily checked that $d_{t}^{\prime}$ is $(\mathrm{l}, \mathrm{r})$ and ( $\mathrm{r}, \mathrm{l}$ )-tderivations of $X$, which is t-regular.

Proposition 4.10: Let $d_{t}$ be a self-map of a BCIK-algebra $X$. Then

1. If $d_{t}$ is a $(l, r)-t$ derivation of $x$, then $d_{t}(x)=d_{t}(x) \wedge x$ for all $x \in X$.
2. If $d_{t}$ is a $(r, l)-t$-derivation of $X$, then $d_{t}(x)=x \wedge d_{t}(x)$ for all $\mathrm{x} \in \mathrm{X}$ if and only if $\mathrm{d}_{\mathrm{t}}$ is t -regular.

## Proof.

1. Let $d_{t}$ be a $(\mathrm{l}, \mathrm{r})$ - t -derivation of X , then
$\mathrm{d}_{\mathrm{t}}(\mathrm{x})=\mathrm{d}_{\mathrm{t}}(\mathrm{x} * 0)$
$=\left(\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * 0\right) \wedge\left(\mathrm{x} * \mathrm{~d}_{\mathrm{t}}(0)\right)$
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) \wedge\left(\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(0)\right)$
$=\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(0)\right\} *\left[\left\{\mathrm{x} * \mathrm{~d}_{\mathrm{t}}(0)\right\} * \mathrm{~d}_{\mathrm{t}}(\mathrm{x})\right]$
$=\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(0)\right\} *\left[\left\{\mathrm{x} * \mathrm{~d}_{\mathrm{t}}(\mathrm{x})\right\} * \mathrm{~d}_{\mathrm{t}}(0)\right]$
$\leq \mathrm{x}^{*}\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(\mathrm{x})\right\}$
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) \wedge \mathrm{x}$.
But $\mathrm{d}_{\mathrm{t}}(\mathrm{x}) \wedge \mathrm{x} \leq \mathrm{d}_{\mathrm{t}}(\mathrm{x})$ is trivial so (1) holds.
2. Let $d_{t}$ be a $(\mathrm{r}, \mathrm{l})$ - t -derivation of X . If $\mathrm{d}_{\mathrm{t}}(\mathrm{x})=\mathrm{x} \leq \mathrm{d}_{\mathrm{t}}(\mathrm{x})$ then $\mathrm{d}_{\mathrm{t}}(0)=0 \wedge \mathrm{~d}_{\mathrm{t}}(0)$
$=\mathrm{d}_{\mathrm{t}}(0) *\left\{\mathrm{~d}_{\mathrm{t}}(0) * 0\right\}$
$=\mathrm{d}_{\mathrm{t}}(0) * \mathrm{~d}_{\mathrm{t}}(0)$
$=0$

Thereby implying $\mathrm{d}_{\mathrm{t}}$ is t -regular. Conversely, suppose that $\mathrm{d}_{\mathrm{t}}$ is $t$-regular, that is $d_{t}(0)=0$, then we have
$\mathrm{d}_{\mathrm{t}}(0)=\mathrm{d}_{\mathrm{t}}\left(\mathrm{x}^{*} 0\right)$
$=\left(\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(0)\right) \wedge\left(\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * 0\right)$
$=\left(x^{*} 0\right) \wedge d_{t}(x)$
$=\mathrm{x} \wedge \mathrm{d}_{\mathrm{t}}(\mathrm{x})$.
The completes the proof.
Theorem 4.11: Let $d_{t}$ be a ( $l, r$ )-t-derivation of a $p$-semi simple BCIK-algebra $X$. Then the following hold:

1. $d_{t}(0)=d_{t}(x) * x$ for all $x \in X$.
2. $\mathrm{d}_{\mathrm{t}}$ is one-0ne.
3. If there is an element $x \in X$ such that $d_{t}(x)=x$, then $d_{t}$ is identity map.
4. If $x \leq y$, then $d_{t}(x) \leq d_{t}(y)$ for all $x, y \in X$.

## Proof.

1. Let $d_{t}$ be a (l, r)-t-derivation of a p -semi simple BCIKalgebra $X$. Then for all $x \in X$, we have
$x^{*} x=0$ and so
$\mathrm{d}_{\mathrm{t}}(0)=\mathrm{d}_{\mathrm{t}}(\mathrm{x} * \mathrm{x})$
$=\left(\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{x}\right) \wedge\left(\mathrm{x} * \mathrm{~d}_{\mathrm{t}}(\mathrm{x})\right)$
$=\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(\mathrm{x})\right\}^{*}\left[\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(\mathrm{x})\right\}^{*}\left\{\mathrm{~d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{x}\right\}\right]$
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{x}$
2. Let $d_{t}(x)=d_{t}(y) \Rightarrow x^{*} t=y^{*} t$, then we have $x=y$ and so $d_{t}$ is one-one.
3. Let $d_{t}$ be t-regular and $x \in X$. Then, $0=d_{t}(0)$ so by the above part(1), we have $0=d_{t}(x) * x$ and, we obtain $d_{t}(x)$ $=\mathrm{x}$ for all $\mathrm{x} \in \mathrm{X}$. Therefore, $\mathrm{d}_{\mathrm{t}}$ is the identity map.
4. It is trivial and follows from the above part (3).

Let $\mathrm{x} \leq \mathrm{y}$ implying $\mathrm{x} * \mathrm{y}=0$. Now,
$\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})=(\mathrm{x} * \mathrm{t}) *(\mathrm{y} * \mathrm{t})$
$=x$ * $y$
$=0$.
Therefore, $\mathrm{d}_{\mathrm{t}}(\mathrm{x}) \leq \mathrm{d}_{\mathrm{t}}(\mathrm{y})$. This completes proof.
Definition 4.12: Let $d_{t}$ be a $t$-derivation of a BCIK-algebra X. Then, $\mathrm{d}_{\mathrm{t}}$ is said to be an isotone t -derivation if $\mathrm{x} \leq \mathrm{y} \Rightarrow \mathrm{d}_{\mathrm{t}}(\mathrm{x})$ $\leq \mathrm{d}_{\mathrm{t}}(\mathrm{y})$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{X}$.

Example 4.13: In Example $4.9(2), \mathrm{d}_{\mathrm{t}}{ }^{\prime}$ is an isotone t derivation, while in Example 4.9(1), $\mathrm{d}_{\mathrm{t}}$ is not an isotone t derivation.

Proposition 4.14: Let $X$ be a BCIK-algebra and $d_{t}$ be a $t-$ derivation on $X$. Then for all $x, y \in X$, the following hold:

1. If $d_{t}(x \wedge y)=d_{t}(x) d_{t}(x) d_{t}(x)$, then $d_{t}$ is an isotone $t-$ derivation
2. If $d_{t}(x \wedge y)=d_{t}(x) * d_{t}(y)$, then $d_{t}$ is an isotone $t-$ derivation.

## Proof.

1. Let $d_{t}(x \wedge y)=d_{t}(x) \wedge d_{t}(x)$. If $x \leq y \Rightarrow x \wedge y=x$ for all $x, y \in X$. Therefore, we have
$\mathrm{d}_{\mathrm{t}}(\mathrm{x})=\mathrm{d}_{\mathrm{t}}(\mathrm{x} \wedge \mathrm{y})$
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) \wedge \mathrm{d}_{\mathrm{t}}(\mathrm{y})$
$\leq d_{t}(y)$.
Henceforth $\mathrm{d}_{\mathrm{t}}(\mathrm{x}) \leq \mathrm{d}_{\mathrm{t}}(\mathrm{y})$ which implies that $\mathrm{d}_{\mathrm{t}}$ is an isotone t derivation.

Let $d_{t}(x * y)=d_{t}(x) * d_{t}(y)$. If $x \leq y \Rightarrow x^{*} y=0$ for all $x, y \in X$.
Therefore, we have
$\mathrm{d}_{\mathrm{t}}(\mathrm{x})=\mathrm{d}_{\mathrm{t}}\left(\mathrm{x}^{*} 0\right)$
$=d_{t}\left\{x^{*}\left(x^{*} y\right)\right\}$

International Journal of Trend in Scientific Research and Development (IJTSRD) @ www.ijtsrd.com eISSN: 2456-6470
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{x} * \mathrm{y})$
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) *\left\{\mathrm{~d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})\right\}$
$\leq d_{t}(y)$.
Thus, $\mathrm{d}_{\mathrm{t}}(\mathrm{x}) \leq \mathrm{d}_{\mathrm{t}}(\mathrm{y})$. This completes the proof.
Theorem 4.15: Let $d_{t}$ be a $t$-regular ( $\mathrm{r}, \mathrm{l}$ )- t -derivation of a BCIK-algebra $X$. Then, the following hold:

1. $d_{t}(x) \leq x$ for all $x \in X$.
2. $d_{t}(x) * y \leq x * d_{t}(y)$ for all $x, y \in X$.
3. $d_{t}(x * y)=d_{t}(x) * y \leq d_{t}(x) * d_{t}(y)$ for all $x, y \in X$.
4. $\operatorname{Ker}\left(\mathrm{d}_{\mathrm{t}}\right)=\left\{\mathrm{x} \in \mathrm{X}: \mathrm{d}_{\mathrm{t}}(\mathrm{x})=0\right\}$ is a sub algebra of X .

## Proof.

1. For any $x \in X$,
we have $\mathrm{d}_{\mathrm{t}}(\mathrm{x})=\mathrm{d}_{\mathrm{t}}(\mathrm{x} * 0)=\left(\mathrm{x} * \mathrm{~d}_{\mathrm{t}}(0)\right) \wedge\left(\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * 0\right)=(\mathrm{x} * 0)$ $\wedge\left(d_{t}(\mathrm{x})^{*} 0\right)=\mathrm{x} \wedge \mathrm{d}_{\mathrm{t}}(\mathrm{x}) \leq \mathrm{x}$.
2. Since $d_{t}(x) \leq x$ for all $x \in X$, then $d_{t}(x) * y \leq x * y \leq x *$ $d_{t}(y)$ and hence the proof follows.
3. For any $x, y \in X$, we have
$\mathrm{d}_{\mathrm{t}}(\mathrm{x} * \mathrm{y})=\left(\mathrm{x} * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})\right) \wedge\left(\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{y}\right)$
$=\left\{\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{y}\right\}^{*}\left[\left\{\mathrm{~d}_{\mathrm{t}}(\mathrm{x})^{*} \mathrm{y}\right\}^{*}\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(\mathrm{x})\right\}\right]$
$=\left\{\mathrm{d}_{\mathrm{t}}(\mathrm{x}) *{ }^{*}\right\}^{*} 0$
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{y} \leq \mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{x})$.
4. Let $\mathrm{x}, \mathrm{y} \in \operatorname{ker}\left(\mathrm{d}_{\mathrm{t}}\right) \Rightarrow \mathrm{d}_{\mathrm{t}}(\mathrm{x})=0=\mathrm{d}_{\mathrm{t}}(\mathrm{y})$. From (3), we have $\mathrm{d}_{\mathrm{t}}(\mathrm{x} * \mathrm{y}) \leq \mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})=0 * 0=0$ implying $\mathrm{d}_{\mathrm{t}}(\mathrm{x} * \mathrm{y}) \leq 0$ and so $d_{t}\left(x^{*} y\right)=0$. Therefore, $x^{*} y \in \operatorname{ker}\left(d_{t}\right)$. Consequently, $\operatorname{ker}\left(\mathrm{d}_{\mathrm{t}}\right)$ is a sub algebra of X . This completes the proof.

Definition 4.16: Let X be a BCIK-algebra and let $\mathrm{d}_{\mathrm{t}}, \mathrm{d}_{\mathrm{t}}$ ' be two self-maps of $X$. Then we define
$d_{t}$ o $d_{t}^{\prime}: X \rightarrow X$ by ( $d_{t}$ o $\left.d_{t}^{\prime}\right)(x)=d_{t}\left(d_{t}^{\prime}(x)\right)$ for all $x \in X$.
Example 4.17: Let $X=\{0, a, b\}$ be a BCIK-algebra which is given in Example 4.4. Let $\mathrm{d}_{\mathrm{t}}$ and $\mathrm{d}_{\mathrm{t}}^{\prime}$ be two
self-maps on X as define in Example 4.9(1) and Example 4.9(2), respectively.

Now, define a self-map $d_{t}$ o $d_{t}$ : $\mathrm{X} \rightarrow \mathrm{X}$ by
$\left(\mathrm{d}_{\mathrm{t}} \mathrm{od}_{\mathrm{t}}^{\prime}\right)(\mathrm{x})=\left\{\begin{array}{l}0 \text { if } x=a, b \\ b \text { if } x=0 .\end{array}\right.$
Then, it easily checked that $\left(d_{t}\right.$ o $\left.d_{t}^{\prime}\right)(x)=d_{t}\left(d_{t}^{\prime}(x)\right)$ for all $x \in$ X.

Proposition 4.18: Let $X$ be a p-semi simple BCIK-algebra $X$ and let $\mathrm{d}_{\mathrm{t}}, \mathrm{d}_{\mathrm{t}}^{\prime}$ be (l,r)-t-derivations of X .
Then, $d_{t}$ o d $d_{t}^{\prime}$ is also a ( $l, r$ )-t-derivation of $X$.
Proof. Let $X$ be a p-semi simple BCIK-algebra. $\mathrm{d}_{\mathrm{t}}$ and $\mathrm{d}_{\mathrm{t}}$ ' are ( $l$, $r)$-t-derivations of $X$. Then for all $x, y \in X$, we get
$\left(d_{t} \circ d_{t}^{\prime}\right)(x * y)=d_{t}\left(d_{t}^{\prime}(x, y)\right)$
$=d_{t}\left[\left(d_{t}^{\prime}(x) * y\right) \wedge\left(x^{*} d_{t}(y)\right)\right]$
$=\mathrm{d}_{\mathrm{t}}\left[\left(\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}^{\prime}(\mathrm{y})\right) *\left\{\left(\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(\mathrm{y})\right)^{*}\left(\mathrm{~d}_{\mathrm{t}}{ }^{\prime}(\mathrm{x}) * \mathrm{y}\right)\right\}\right]$
$=\mathrm{d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}{ }^{\prime}(\mathrm{x})^{*} \mathrm{y}\right)$
$=\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{y})\right)\right\}^{*}\left[\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}{ }^{\prime}(\mathrm{y})\right)\right\}^{*}\left\{\mathrm{~d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}{ }^{\prime}(\mathrm{x}) * \mathrm{y}\right)\right\}\right]$
$=\left\{\mathrm{d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x}) * \mathrm{y}\right)\right\} \wedge\left\{\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{y})\right)\right\}$
$=\left(\left(d_{t} \circ d_{t}^{\prime}\right)(x) * y\right) \wedge\left(x *\left(d_{t} o d_{t}^{\prime}\right)(y)\right)$.
Therefore, $\left(d_{t} o d_{t}{ }^{\prime}\right)$ is a $(l, r)-t$-derivation of $X$.
Similarly, we can prove the following.

Proposition 4.19: Let $X$ be a p-semi simple BCIK-algebra and let $d_{t}, d_{t}^{\prime}$ be ( $\mathrm{r}, \mathrm{l}$ )-t-derivations of X . Then, $\mathrm{d}_{\mathrm{t}} \mathrm{o} \mathrm{d}_{\mathrm{t}}$ ' is also a ( $\mathrm{r}, \mathrm{l}$ )-t-derivation of X .

Combining Propositions 3.18 and 3.19, we get the following.
Theorem 4.20: Let $X$ be a p-semi simple BCIK-algebra and let $d_{t}, d_{t}^{\prime}$ be $t$-derivations of $X$. Then, $d_{t} o d_{t}^{\prime}$ is also a $t$ derivation of $X$.

Now, we prove the following theorem
Theorem 4.21: Let $X$ be a p-semi simple BCIK-algebra and let $d_{t}, d_{t}^{\prime}$ be $t$-derivations of $X$.
Then $d_{t}$ o $d_{t}^{\prime}=d_{t}^{\prime}$ o $d_{t}$.
Proof. Let X be a p-semi simple BCIK-algebra. $\mathrm{d}_{\mathrm{t}}$ and $\mathrm{d}_{\mathrm{t}}{ }^{\prime}, \mathrm{t}$ derivations of $X$. Suppose $d_{t}^{\prime}$ is a
( $\mathrm{l}, \mathrm{r}$ )-t-derivation, then for all $\mathrm{x}, \mathrm{y} \in \mathrm{X}$, we have
$\left(d_{t} o d_{t}^{\prime}\right)(x * y)=d_{t}\left(d_{t}{ }^{\prime}\left(x^{*} y\right)\right)$
$=d_{t}\left[\left(d_{t}^{\prime}(x) * y\right) \wedge\left(x^{*} d_{t}(y)\right)\right]$
$=d_{t}\left[\left(x * d_{t}^{\prime}(y)\right) *\left\{\left(x * d_{t}(y)\right) *\left(d_{t}^{\prime}(x) * y\right)\right\}\right]$
$=\mathrm{d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}{ }^{\prime}(\mathrm{x}) * \mathrm{y}\right)$
As $\mathrm{d}_{\mathrm{t}}$ is a $(\mathrm{r}, \mathrm{l})$ - t -derivation, then
$=\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})\right) \wedge\left(\mathrm{d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x})\right)^{*} \mathrm{y}\right)$
$=d_{t}^{\prime}(x) * d_{t}(y)$.
Again, if $\mathrm{d}_{\mathrm{t}}$ is a (r, l)-t-derivation, then we have
$\left(d_{t} o d_{t}^{\prime}\right)(x * y)=d_{t}^{\prime}\left[d_{t}(x * y)\right]$
$=\mathrm{d}_{\mathrm{t}}^{\prime}\left[\left(\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}}(\mathrm{y})\right) \wedge\left(\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{y}\right)\right]$
$=\mathrm{d}_{\mathrm{t}}^{\prime}\left[\mathrm{x} * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})\right]$
But $d_{t}^{\prime}$ is a $(l, r)-t$-derivation, then
$=\left(d_{t^{\prime}}^{\prime}(x) * d_{t}(y)\right) \wedge\left(x * d_{t}^{\prime}\left(d_{t}(y)\right)\right.$
$=\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})$
Therefore, we obtain
$\left(d_{t} \circ d_{t}^{\prime}\right)(x * y)=\left(d_{t}^{\prime} \circ d_{t}\right)(x * y)$.
By putting $y=0$, we get
$\left(d_{t}\right.$ o $\left.d_{t}^{\prime}\right)(x)=\left(d_{t}^{\prime}\right.$ o $\left.d_{t}\right)(x)$ for all $x \in X$.
Hence, $d_{t}$ o $d_{t}^{\prime}=d_{t}^{\prime} \circ d_{t}$. This completes the proof.
Definition 4.22: Let $X$ be a BCIK-algebra and let $d_{t}, d_{t}$ two self-maps of $X$. Then we define $d_{t}{ }^{*} d_{t}: X \rightarrow X$ by $\left(d_{t}{ }^{*} d_{t}{ }^{\prime}\right)(x)=$ $\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}^{\prime}(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{X}$.
Example 4.23: Let $X=\{0, a, b\}$ be BCIK-algebra which is given in Example 3.4. let $d_{t}$ and $d_{t}^{\prime}$ be two

Self-maps on X as defined in Example 4.9 (1) and Example 4.10 (2), respectively.

Now, define a self-map $\mathrm{d}_{\mathrm{t}}{ }^{*} \mathrm{~d}_{\mathrm{t}}{ }^{\prime}: \mathrm{X} \rightarrow \mathrm{X}$ by $\left(\mathrm{d}_{\mathrm{t}}{ }^{*} \mathrm{~d}_{\mathrm{t}}{ }^{\prime}\right)(\mathrm{x})=$ $\left\{\begin{array}{c}0 \text { if } x=a, b \\ b \text { if } x=0 .\end{array}\right.$

Then, it is easily checked that $\left(d_{t}{ }^{*} d_{t}^{\prime}\right)(x)=d_{t}(x) * d_{t}{ }^{\prime}(x)$ for all $x \in X$.
Theorem 4.24: Let $X$ be a p-semi simple BCIK-algebra and let $d_{t}, d_{t}^{\prime}$ be $t$-derivations of $X$.

Then $\mathrm{d}_{\mathrm{t}}{ }^{*} \mathrm{~d}_{\mathrm{t}}{ }^{\prime}=\mathrm{d}_{\mathrm{t}}{ }^{*} \mathrm{~d}_{\mathrm{t}}$.
Proof. Let $X$ be a p-semi simple BCIK-algebra. $d_{t}$ and $d_{t}{ }^{\prime}, t-$ derivations of X .

Since $d_{t}{ }^{\prime}$ is a ( $r, l$ )-t-derivation of $X$, then for all $x, y \in X$, we have

International Journal of Trend in Scientific Research and Development (IJTSRD) @ www.ijtsrd.com eISSN: 2456-6470
$\left(d_{t}\right.$ o $\left.d_{t}^{\prime}\right)\left(x^{*} y\right)=d_{t}\left(d_{t}^{\prime}\left(x^{*} y\right)\right)$
$=d_{t}\left[\left(x^{*} d_{t}{ }^{\prime}(y)\right) \wedge\left(d_{t}{ }^{\prime}(x) * y\right)\right]$
$=d_{t}\left[\left(x * d_{t}^{\prime}(y)\right]\right.$
But $d_{t}$ is a (l, r)-r-derivation, so
$=\left(d_{t}(x) * d_{t}^{\prime}(y)\right) \wedge\left(x^{*} d_{t}\left(d_{t}^{\prime}(y)\right)\right.$
$=\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{x})$.
Again, if $d_{t}^{\prime}$ is a $(\mathrm{l}, \mathrm{r})-\mathrm{t}$-derivation of X , then for all $\mathrm{x}, \mathrm{y} \in \mathrm{X}$, we have
$\left(d_{t} o d_{t}^{\prime}\right)(x * y)=d_{t}\left[d_{t}^{\prime}\left(x^{*} y\right)\right]$
$=\mathrm{d}_{\mathrm{t}}\left[\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x})^{*} \mathrm{y}\right) \wedge\left(\mathrm{x}^{*} \mathrm{~d}_{\mathrm{t}^{\prime}}(\mathrm{y})\right)\right]$
$=d_{t}\left[\left(x^{*} d_{t}^{\prime}(y)\right) *\left\{\left(x * d_{t}^{\prime}(y)\right) *\left(d_{t}^{\prime}(x) * y\right)\right\}\right]$
$=d_{t}\left(d_{t}^{\prime}(x) * y\right)$.
As $d_{t}$ is a $(r, l)$ - $t$-derivation, then
$=\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})\right) \wedge\left(\mathrm{d}_{\mathrm{t}}\left(\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x})\right)^{*} \mathrm{y}\right)$
$=d_{t}^{\prime}(x) * d_{t}(y)$.
Henceforth, we conclude
$\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}^{\prime}(\mathrm{y})=\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}(\mathrm{y})$
By putting $y=x$, we get
$\mathrm{d}_{\mathrm{t}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{t}}^{\prime}(\mathrm{x})=\mathrm{d}_{\mathrm{t}}^{\prime}(\mathrm{x})^{*} \mathrm{~d}_{\mathrm{t}}(\mathrm{x})$
$\left(\mathrm{d}_{\mathrm{t}} * \mathrm{~d}_{\mathrm{t}}^{\prime}\right)(\mathrm{x})=\left(\mathrm{d}_{\mathrm{t}}^{\prime} * \mathrm{~d}_{\mathrm{t}}\right)(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{X}$.
Henced ${ }_{t}^{*} d_{t}^{\prime}=d_{t}^{\prime} * d_{t}$. This completes the proof.

## 5. f-derivation of BCIK-algebra

In what follows, let be an endomorphism of $X$ unless otherwise specified.
Definition 5.1: Let $X$ be a BCIK algebra. By a left f -derivation (briefly, (l, r)-f-derivation) of X, a self-map $\mathrm{d}_{\mathrm{f}}\left(\mathrm{x}^{*} \mathrm{y}\right)=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x})^{*}\right.$ $f(y)) \wedge\left(f(x) * d_{f}(y)\right)$ for all $x, y \in X$ is meant, where $f$ is an endomorphism of $X$. If $d_{f}$ satisfies the identity $d_{f}\left(x^{*} y\right)=(f(x)$ $\left.{ }^{*} d_{f}(y)\right) \wedge\left(d_{f}(x) * f(y)\right)$ for all $x, y \in X$, then it is said that $d_{f}$ is a right-left f-derivation (briefly, (r, l)-f-derivation) of X. Moreover, if $\mathrm{d}_{\mathrm{f}}$ is both an ( $\mathrm{r}, \mathrm{l}$ )-f-derivation, it is said that $\mathrm{d}_{\mathrm{f}}$ is an f-derivation.
Example 5.2: Let $\mathrm{X}=\{0,1,2,3,4,5\}$ be a BCIK-algebra with the following Cayley table:

| $*$ | 0 | 1 | 2 | 3 | 4 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 2 | 2 | 2 | 2 |
| 1 | 1 | 0 | 2 | 2 | 2 | 2 |
| 2 | 2 | 2 | 0 | 0 | 0 | 0 |
| 3 | 3 | 2 | 1 | 0 | 0 | 0 |
| 4 | 4 | 2 | 1 | 1 | 0 | 1 |
| 5 | 5 | 2 | 1 | 1 | 1 | 0 |

Define a Map df: $\mathrm{X} \rightarrow \mathrm{X}$ by
$\mathrm{d}_{\mathrm{f}}=\left\{\begin{array}{l}2 \text { if } x=0,1, \\ 0 \text { otherwise },\end{array}\right.$
and define and endomorphism $f$ of $X$ by
$\mathrm{f}(\mathrm{x})=\left\{\begin{array}{l}2 \text { if } x=0,1, \\ 0 \text { otherwise },\end{array}\right.$
That it is easily checked that $d_{f}$ is both derivation and $f$ derivation of $X$.

Example 5.3: Let X be a BCIK-algebra as in Example 2.2. Define a map $\mathrm{d}_{\mathrm{f}}: \mathrm{X} \rightarrow \mathrm{X}$ by
$\mathrm{d}_{\mathrm{f}}=\left\{\begin{array}{c}2 \text { if } x=0,1, \\ 0 \text { otherwise },\end{array}\right.$

Then it is easily checked that $d_{f}$ is a derivation of $X$.
Define an endomorphism $f$ of $X$ by
$f(x)=0$, for all $x \in X$.
Then $d_{f}$ is not an $f$-derivation of $X$ since
$\mathrm{d}_{\mathrm{f}}(2 * 3)=\mathrm{d}_{\mathrm{f}}(0)=2$,
but
$\left(\mathrm{d}_{\mathrm{f}}(2) * \mathrm{f}(3)\right) \wedge\left(\mathrm{f}(2) * \mathrm{~d}_{\mathrm{f}}(3)\right)=(0 * 0) \wedge\left(0^{*} 0\right)=0 \wedge 0=0$,
And thus $\mathrm{d}_{\mathrm{f}}(2 * 3) \neq\left(\mathrm{d}_{\mathrm{f}}(2) * \mathrm{f}(3)\right) \wedge\left(\mathrm{f}(2) * \mathrm{~d}_{\mathrm{f}}(3)\right)$.
Remark 5.4: From Example 5.3, we know that there is a derivation of $X$ which is not an f-derivation $X$.
Example 2.5: Let $X=\{0,1,2,3,4,5\}$ be a BCIK-algebra with the following Cayley table:

| $*$ | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 3 | 2 | 3 | 2 |
| 1 | 1 | 1 | 5 | 4 | 3 | 2 |
| 2 | 2 | 2 | 0 | 3 | 0 | 3 |
| 3 | 3 | 3 | 2 | 0 | 2 | 0 |
| 4 | 4 | 2 | 1 | 5 | 0 | 3 |
| 5 | 5 | 3 | 4 | 1 | 2 | 0 |

Define a map $\mathrm{d}_{\mathrm{f}}: \mathrm{X} \rightarrow \mathrm{X}$ by
$\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\left\{\begin{array}{lll}0 & \text { if } & x=0,1, \\ 2 & \text { if } & x=2,4, \\ 3 & \text { if } & x=3,5,\end{array}\right.$
and define an endomorphism $f$ of $X$ by

$$
\mathrm{f}(\mathrm{x})=\left\{\begin{array}{l}
0 \text { if } x=0,1 \\
2 \text { if } x=2,4 \\
3 \text { if } x=3,5
\end{array}\right.
$$

Then it is easily checked that $d_{f}$ is both derivation and $f$ derivation of X .
Example 5.6: Let X be a BCIK-algebra as in Example 5.5.
Define a map $\mathrm{d}_{\mathrm{f}} \mathrm{X} \rightarrow \mathrm{X}$ by
$\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\left\{\begin{array}{l}0 \text { if } x=0,1, \\ 2 \text { if } x=2,4, \\ 3 \text { if } x=3,5,\end{array}\right.$
Then it is easily checked that $d_{f}$ is a derivation of $X$.
Define an endomorphism $f$ of $X$ by
$\mathrm{f}(0)=0, \mathrm{f}(1)=1, \mathrm{f}(2)=3 \mathrm{f}(3)=2, \mathrm{f}(4)=5, \mathrm{f}(5)=4$.
Then $d_{f}$ is not an $f$-derivation of $X$ since
$\mathrm{d}_{\mathrm{f}}(2 * 3)=\mathrm{d}_{\mathrm{f}}(3)=3$,
but
$\left(\mathrm{d}_{\mathrm{f}}(2) * \mathrm{f}(3)\right) \wedge\left(\mathrm{f}(2) * \mathrm{~d}_{\mathrm{f}}(3)\right)=(2 * 2) \wedge(3 * 3)=0 \wedge 0=0$,
And thus $\mathrm{d}_{\mathrm{f}}(2 * 3) \neq\left(\mathrm{d}_{\mathrm{f}}(2) * \mathrm{f}(3)\right) \wedge\left(\mathrm{f}(2) * \mathrm{~d}_{\mathrm{f}}(3)\right)$.
Example 5.7: Let X be a BCIK-algebra as in Example 2.5. Define a map $\mathrm{d}_{\mathrm{f}}: \mathrm{X} \rightarrow \mathrm{X}$ byd $_{\mathrm{f}}(0)=0, \mathrm{~d}_{\mathrm{f}}(1)=1, \mathrm{~d}_{\mathrm{f}}(2)=3, \mathrm{~d}_{\mathrm{f}}(3)$ $=2, \mathrm{~d}_{\mathrm{f}}(4)=5, \mathrm{~d}_{\mathrm{f}}(5)=4$,

International Journal of Trend in Scientific Research and Development (IJTSRD) @ www.ijtsrd.com eISSN: 2456-6470

Then $d_{f}$ is not a derivation of $X$ since
$\mathrm{d}_{\mathrm{f}}(2 * 3)=\mathrm{d}_{\mathrm{f}}(3)=2$,
$\left(\mathrm{d}_{\mathrm{f}}(2) * 3\right) \wedge\left(2 * \mathrm{~d}_{\mathrm{f}}(3)\right)=(3 * 3) \wedge(2 * 2)=0 \wedge 0=0$,
And thus And thus $\mathrm{d}_{\mathrm{f}}(2 * 3) \neq\left(\mathrm{d}_{\mathrm{f}}(2) * 3\right) \wedge\left(2 * \mathrm{~d}_{\mathrm{f}}(3)\right)$.
Define an endomorphism $f$ of $X$ by
$\mathrm{f}(0)=0, \mathrm{f}(1)=1, \mathrm{f}(2)=3, \mathrm{f}(3)=2, \mathrm{f}(4)=5, \mathrm{f}(5)=4$.
Then it is easily checked that $\mathrm{d}_{\mathrm{f}}$ is an f-derivation of X .
Remark 5.8: From Example 5.7, we know there is an fderivation of $X$ which is not a derivation of $X$.

For convenience, we denote $\mathrm{f}_{\mathrm{x}}=0 *(0 * \mathrm{f}(\mathrm{x}))$ for all $\mathrm{x} \in \mathrm{X}$. Note that $\mathrm{f}_{\mathrm{x}} \in \mathrm{L}_{\mathrm{p}}(\mathrm{X})$.
Theorem 5.9: Let $d_{f}$ be a self-map of a BCIK-algebra $X$ define by $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\mathrm{f}_{\mathrm{x}}$ for all $\mathrm{x} \in \mathrm{X}$.

Then $\mathrm{d}_{\mathrm{f}}$ is an (l, r)-f-derivation of X . Moreover, if X is commutative, then $d_{f}$ is an ( $\mathrm{r}, \mathrm{l}$ )-f-derivation of X .
Proof. Let $\mathrm{x}, \mathrm{y} \in \mathrm{X}$
Since
0 * $\left(0^{*}\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})\right)\right)=0 *\left(0 *\left((0 *(0 * \mathrm{f}(\mathrm{x})))^{*} \mathrm{f}(\mathrm{y})\right)\right)$
$=0$ * $((0$ * $((0 * f(y)) *(0 * f(x))))$
$=0{ }^{*}(0 *(0 * f(y * x)))=0 * f(y * x)$
$=0 *(f(y) * f(x))=(0 * f(y)) *(0 * f(x))$
$=(0 *(0 * f(x))) * f(y)=f_{x} * f(y)$,
We have $f_{x} * f(y) \in L_{p}(X)$, and thus
$\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})=\left(\mathrm{f}(\mathrm{x}) * \mathrm{f}_{\mathrm{y}}\right) *\left(\left(\mathrm{f}(\mathrm{x}) * \mathrm{f}_{\mathrm{y}}\right) *\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})\right)\right)$,
It follows that
$\mathrm{d}_{\mathrm{f}}\left(\mathrm{x}^{*} \mathrm{x}\right)=\mathrm{f}_{\mathrm{x}} * \mathrm{x}=0 *(0 * \mathrm{f}(\mathrm{x} * \mathrm{y}))=0 *(0 *(\mathrm{f}(\mathrm{x}) * \mathrm{f}(\mathrm{y})))$
$=\left(0 *(0 * f(x)) *(0 *(0 * f(y)))=f_{x} * f_{y}\right.$
$=\left(0 *\left(0 * f_{x}\right)\right) *(0 *(0 * f(y)))=0 *\left(0 *\left(f_{x} * f(y)\right)\right)$
$=\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})=\left(\mathrm{f}(\mathrm{x}) * \mathrm{f}_{\mathrm{y}}\right) *\left(\left(\mathrm{f}(\mathrm{x}) * \mathrm{f}_{\mathrm{y}}\right) *\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})\right)\right)$
$=\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})\right) \wedge\left(\mathrm{f}(\mathrm{x}) \wedge \mathrm{f}_{\mathrm{y}}\right)=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right) \wedge\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right)$,
And so $d_{f}$ is an ( $1, r$ )-f-derivation of $X$. Now, assume that $X$ is commutative. So $\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})$ and $\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})$ belong to the same branch $\mathrm{x}, \mathrm{y} \in \mathrm{X}$, we have
$\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})=\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})=\left(0 *\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}(\mathrm{y})\right)\right)$
$=\left(0 *\left(0 * f_{x}\right)\right) *(0 *(0 * f(y)))$
$=\mathrm{f}_{\mathrm{x}} * \mathrm{f}_{\mathrm{x}} \in V\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}_{\mathrm{x}}\right)$,
And so $\mathrm{f}_{\mathrm{x}} * \mathrm{f}_{\mathrm{x}}=(0 *(0 * \mathrm{f}(\mathrm{x})))^{*}\left(0 *\left(0 * \mathrm{f}_{\mathrm{y}}\right)\right)=0 *(0 *(\mathrm{f}(\mathrm{x})$ * $\left.\left.\mathrm{f}_{\mathrm{y}}\right)\right)=0{ }^{*}\left(0^{*}\left(\mathrm{f}(\mathrm{x}){ }^{*} \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right) \leq \mathrm{f}(\mathrm{x}){ }^{*} \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right.$, which implies that $\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y}) \in \mathrm{V}\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}_{\mathrm{x}}\right)$. Hence, $\mathrm{d}_{\mathrm{f}}(\mathrm{y}) * \mathrm{f}(\mathrm{y})$ and $\mathrm{f}(\mathrm{x}){ }^{*} \mathrm{~d}_{\mathrm{f}}(\mathrm{y})$ belong to the same branch, and so
$\mathrm{d}_{\mathrm{f}}(\mathrm{x} * \mathrm{x})=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right) \wedge\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right)$
$=\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right) \wedge\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right)$.
This completes the proof.
Proposition 5.10: Let $\mathrm{d}_{\mathrm{f}}$ be a self-map of a BCIK-algebra. Then the following hold.

1. If $d_{f}$ is an $(l, r)-f$-derivation of $X$, then $d_{f}(x)=d_{f}(x) \wedge$ $f(x)$ for all $x \in X$.
2. If $d_{f}$ is an ( $\left.\mathrm{r}, \mathrm{l}\right)$-f-derivation of X , then $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\mathrm{f}(\mathrm{x}) \wedge \mathrm{d}_{\mathrm{f}}$ $(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{X}$ if and only if $\mathrm{d}_{\mathrm{f}}(0)=0$.

## Proof.

1. Let $d_{f}$ is an $(r, l)-f$-derivation of $X$, Then, $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\mathrm{d}_{\mathrm{f}}(\mathrm{x} * 0)=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(0)\right) \wedge\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(0)\right)$
$=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * 0\right) \wedge\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(0)\right)=\mathrm{d}_{\mathrm{f}}(\mathrm{x}) \wedge\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(0)\right)$
$=\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(0)\right) *\left(\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(0)\right) * \mathrm{~d}_{\mathrm{f}}(\mathrm{x})\right)$
$=\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(0)\right) *\left(\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(0)\right) * \mathrm{~d}_{\mathrm{f}}(0)\right)$
$\leq \mathrm{f}(\mathrm{x}) *\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{x})\right)=\mathrm{d}_{\mathrm{f}}(\mathrm{x}) \wedge \mathrm{f}(\mathrm{x})$.
But $\mathrm{d}_{\mathrm{f}}(\mathrm{x}) \wedge \mathrm{f}(\mathrm{x}) \leq \mathrm{d}_{\mathrm{f}}(\mathrm{x})$ is trivial and so (1) holds.
2. Let $\mathrm{d}_{\mathrm{f}}$ be an $(\mathrm{r}, \mathrm{l})-\mathrm{f}$-derivation of X . If $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{x})$ for all $x \in X$, then for $x=0, d_{f}(0)=f(0) * d_{f}(0)=0 \wedge f(0)$ $=\mathrm{d}_{\mathrm{f}}(0) *\left(\mathrm{~d}_{\mathrm{f}}(0) * 0\right)=0$.

Conversely, if $\mathrm{d}_{\mathrm{f}}(0)=0$, then $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\mathrm{d}_{\mathrm{f}}(\mathrm{x} * 0)=\left(\mathrm{f}(\mathrm{x}) *\left(\mathrm{~d}_{\mathrm{f}}\right.\right.$ (0)) $\wedge\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(0)\right)=$
$\left.\left(\mathrm{f}(\mathrm{x})^{*} 0\right)\right) \wedge\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x})^{*} 0\right)=\mathrm{f}(\mathrm{x}) \wedge \mathrm{d}_{\mathrm{f}}(\mathrm{x})$, ending the proof.
Proposition 5.11: Let $d_{f}$ be an ( $\mathrm{l}, \mathrm{r}$ )-f-derivation of a BCIKalgebra $X$. Then,

1. $d_{f}(x) \in L_{p}(X)$, then is $d_{f}(0)=0 *\left(0 * d_{f}(x)\right)$;
2. $\quad d_{f}(a)=d_{f}(0) *(0 * f(a))=d_{f}(0)+f(a)$ for all a $\in L_{p}(X)$;
3. $d_{f}(a) \in L_{p}(X)$ for all $a \in L_{p}(X)$;
4. $d_{f}(a+b)=d_{f}(a)+d_{f}(b)-d_{f}(0)$ for all $a, b \in L_{p}(X)$.

## Proof.

1. The proof follows from Proposition 5.10(1).
2. Let $\mathrm{G} \in \mathrm{L}_{\mathrm{p}}(\mathrm{X})$, then $\mathrm{a}=0^{*}\left(0^{*} \mathrm{a}\right)$, and so $\mathrm{f}(\mathrm{a})=0^{*}\left(0^{*}\right.$ $\mathrm{f}(\mathrm{a})$ ), that is, $\mathrm{f}(\mathrm{b}) \in \mathrm{L}_{\mathrm{p}}(\mathrm{X})$.

Hence
$\mathrm{d}_{\mathrm{f}}(\mathrm{a})=\mathrm{d}_{\mathrm{f}}(0 *(0 * a))$
$=\left(\mathrm{d}_{\mathrm{f}}(0) * \mathrm{f}(0 * \mathrm{a})\right) \wedge\left(\mathrm{f}(0) * \mathrm{~d}_{\mathrm{f}}(0 * \mathrm{a})\right)$
$=\left(\mathrm{d}_{\mathrm{f}}(0) * \mathrm{f}(0 * \mathrm{a})\right) \wedge\left(0 * \mathrm{~d}_{\mathrm{f}}(0 * \mathrm{a})\right)$
$=\left(0 * \mathrm{~d}_{\mathrm{f}}(0 * \mathrm{a})\right) *\left(\left(0 * \mathrm{~d}_{\mathrm{f}}(0 * \mathrm{a})\right) *\left(\mathrm{~d}_{\mathrm{f}}(0) * \mathrm{f}(0 * \mathrm{a})\right)\right)$
$=\left(0 * \mathrm{~d}_{\mathrm{f}}(0 * \mathrm{a})\right) *\left(\left(0^{*}\left(\mathrm{~d}_{\mathrm{f}}(0) * \mathrm{f}(0 * \mathrm{a})\right)\right) * \mathrm{~d}_{\mathrm{f}}(0 * \mathrm{a})\right)$
$=0 *\left(0 *\left(\mathrm{~d}_{\mathrm{f}}(0) *(0 * \mathrm{f}(\mathrm{a}))\right)\right)$
$=d_{f}(0) *(0 * f(a))=d_{f}(0)+f(a)$.
3. The proof follows directly from (2).
4. Let $a, b \in L_{p}(X)$. Note that $a+b \in L_{p}(X)$, so from (2), we note that
$\mathrm{d}_{\mathrm{f}}(\mathrm{a}+\mathrm{b})=\mathrm{d}_{\mathrm{f}}(0)+\mathrm{f}(\mathrm{a})+\mathrm{d}_{\mathrm{f}}(0)+\mathrm{f}(\mathrm{b})-\mathrm{d}_{\mathrm{f}}(0)=\mathrm{d}_{\mathrm{f}}(\mathrm{a})+\mathrm{d}_{\mathrm{f}}(0)-$ $d_{f}(0)$.
Proposition 5.12: Let $\mathrm{d}_{\mathrm{f}}$ be a ( $\mathrm{r}, \mathrm{l}$ )-f-derivation of a BCIKalgebra $X$. Then,

1. $d_{f}(a) \in G(X)$ for all a $\in G(X)$;
2. $d_{f}(a) \in L_{p}(X)$ for all a $\in G(X)$;
3. $d_{f}(a)=f(a) * d_{f}(0)=f(a)+d_{f}(a)$ for all $a, b \in L_{p}(X)$;
4. $d_{f}(a+b)=d_{f}(a)+d_{f}(b)-d_{f}(0)$ for all $a, b \in L_{p}(X)$.

## Proof.

1. For any a $€ \mathrm{G}(\mathrm{X})$, we have $\mathrm{d}_{\mathrm{f}}(\mathrm{a})=\mathrm{d}_{\mathrm{f}}(0$ * a$)=\left(\mathrm{f}(0)\right.$ * $\mathrm{d}_{\mathrm{f}}$ (a) $) \wedge\left(d_{f}(0)+f(a)\right)$
$=\left(d_{f}(0)+f(a)\right) *\left(\left(d_{f}(0)+f(a)\right) *\left(0 * d_{f}(0)\right)\right)=0 * d_{f}(0)$, and so $\mathrm{d}_{\mathrm{f}}(\mathrm{a}) \in \mathrm{G}(\mathrm{X})$.
2. For any a $\in L_{p}(X)$, we get
$\mathrm{d}_{\mathrm{f}}(\mathrm{a})=\mathrm{d}_{\mathrm{f}}\left(0^{*}\left(0^{*} \mathrm{a}\right)\right)=\left(0^{*} \mathrm{~d}_{\mathrm{f}}\left(0^{*} \mathrm{a}\right)\right) \wedge\left(\mathrm{d}_{\mathrm{f}}(0) * \mathrm{f}(0 * \mathrm{a})\right)$
$=\left(\mathrm{d}_{\mathrm{f}}(0) * \mathrm{f}(0 * \mathrm{a})\right) *\left(\left(\mathrm{~d}_{\mathrm{f}}(0) * \mathrm{f}(0 * \mathrm{a})\right) *\left(0 * \mathrm{~d}_{\mathrm{f}}(0 * a)\right)\right)$
$=0 * d_{f}(0 * a) \in L_{p}(X)$.
3. For any a $\in \mathrm{L}_{\mathrm{p}}(\mathrm{X})$, we get
$\mathrm{d}_{\mathrm{f}}(\mathrm{a})=\mathrm{d}_{\mathrm{f}}(\mathrm{a} * 0)=\left(\mathrm{f}(\mathrm{a}) * \mathrm{~d}_{\mathrm{f}}(0)\right) \wedge\left(\mathrm{d}_{\mathrm{f}}(\mathrm{a}) * \mathrm{f}(0)\right)$
$=\mathrm{d}_{\mathrm{f}}(\mathrm{a}) *\left(\mathrm{~d}_{\mathrm{f}}(\mathrm{a}) *\left(\mathrm{f}(\mathrm{a}) * \mathrm{~d}_{\mathrm{f}}(0)\right)\right)=\mathrm{f}(\mathrm{a}) * \mathrm{~d}_{\mathrm{f}}(0)$
$=f(a) *\left(0 * d_{f}(0)\right)=f(a)+d_{f}(a)$.
4. The proof from (3). This completes the proof.

Using Proposition 5.12, we know there is an (l,r)-f-derivation which is not an (r,l)-f-derivation as shown in the following example.

International Journal of Trend in Scientific Research and Development (IJTSRD) @ www.ijtsrd.com eISSN: 2456-6470

Example 5.13: Let Z be the set of all integers and "-" the minus operation on Z . Then ( $\mathrm{Z},-, 0$ ) is a BCIK-algebra. Let $\mathrm{d}_{\mathrm{f}}$ : $\mathrm{X} \rightarrow \mathrm{X}$ be defined by $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\mathrm{f}(\mathrm{x})-1$ for all $\mathrm{x} \in \mathrm{Z}$.

Then, $\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x})-\mathrm{f}(\mathrm{y})\right) \wedge\left(\mathrm{f}(\mathrm{x})-\mathrm{d}_{\mathrm{f}}(\mathrm{y})\right)=(\mathrm{f}(\mathrm{x})-1-\mathrm{f}(\mathrm{y})) \wedge(\mathrm{f}(\mathrm{x})$
$-(f(y)-1))$
$=(f(x-Y)-1) \wedge(f(x-y)+1)$
$=(f(x-Y)+1)-2=f(x-Y)-1$
$=d_{f}(\mathrm{x}-\mathrm{y})$.
Hence, $\mathrm{d}_{\mathrm{f}}$ is an $(\mathrm{l}, \mathrm{r})$-f-derivation of $X$. $\operatorname{But}_{\mathrm{f}}(0)=\mathrm{f}(0)-1=-1$ $\neq 1=\mathrm{f}(0)-\mathrm{d}_{\mathrm{f}}(0)=0-\mathrm{d}_{\mathrm{f}}(0)$,
that is, $\mathrm{d}_{\mathrm{f}}(0) \notin \mathrm{G}(\mathrm{X})$. Therefore, $\mathrm{d}_{\mathrm{f}}$ is not an (r, l)-f-derivation of X by Proposition 2.12(1).

## 6. Regular f-derivations

Definition 6.1: An f-derivation $\mathrm{d}_{\mathrm{f}}$ of a BCIK-algebra X is said to be a regular if $d_{f}(0)=0$
Remark 6.2: we know that the f-derivations $d_{f}$ in Example 5.5 and 5.7 are regular.

Proposition 6.3: Let X be a commutative BCIK-algebra and let $d_{f}$ be a regular ( $\mathrm{r}, \mathrm{l}$ )-f-derivation of X . Then the following hold.

1. Both $\mathrm{f}(\mathrm{x})$ and $\mathrm{d}_{\mathrm{f}}(\mathrm{x})$ belong to the same branch for all $\mathrm{x} \in$ X .
2. $d_{f}$ is an $(l, r)-f$-derivation of $X$.

## Proof.

1. Let $\mathrm{x} \in \mathrm{X}$. Then,
$0=\mathrm{d}_{\mathrm{f}}(0)=\mathrm{d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}{ }^{*} \mathrm{x}\right)$
$=\left(f\left(\mathrm{a}_{\mathrm{x}}\right) * \mathrm{~d}_{\mathrm{f}}(\mathrm{x})\right) \wedge\left(\mathrm{d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}\right) * \mathrm{f}(\mathrm{x})\right)$
$=\left(\mathrm{d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}\right) * \mathrm{f}(\mathrm{x})\right) *\left(\left(\mathrm{~d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}\right) * \mathrm{f}(\mathrm{x})\right) *\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}\right)\right)\right)$
$=\left(\mathrm{d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}\right) * \mathrm{f}(\mathrm{x})\right) *\left(\left(\mathrm{~d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}\right) * \mathrm{f}(\mathrm{x})\right) *\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}\left(\mathrm{a}_{\mathrm{x}}\right)\right)\right)$
$=f_{x} * d_{f}\left(a_{x}\right)$ since $f_{x} * d_{f}\left(a_{x}\right) \in L_{p}(X)$,
And so $\mathrm{f}_{\mathrm{x}} \leq \mathrm{d}_{\mathrm{f}}(\mathrm{x})$. This shows that $\mathrm{d}_{\mathrm{f}}(\mathrm{x}) \in \mathrm{V}(\mathrm{X})$, Clearly, $\mathrm{f}(\mathrm{x}) €$ $\mathrm{V}(\mathrm{X})$.
2. By (1), we have $\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y}) \in \mathrm{V}\left(\mathrm{f}_{\mathrm{x}} * \mathrm{f}_{\mathrm{y}}\right)$ and $\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y}) €$ $\mathrm{V}\left(\mathrm{f}_{\mathrm{x}}{ }^{*} \mathrm{f}_{\mathrm{y}}\right)$. Thus
$\mathrm{d}_{\mathrm{f}}(\mathrm{x} * \mathrm{y})=\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right) \wedge\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right)=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right) \wedge$ $\left(f(x) * d_{f}(y)\right)$, which implies that
$\mathrm{d}_{\mathrm{f}}$ is an (l,r)-f-derivation of X .
Remark 6.4: The f-derivations $\mathrm{d}_{\mathrm{f}}$ in Examples 5.5 and 5.7 are regular f -derivations but we know that the ( $\mathrm{l}, \mathrm{r}$ )-f-derivation $d_{f}$ in Example 5.2 is not regular. In the following, we give some properties of regular f-derivations.

Definition 6.5: Let $X$ be a BCIK-algebra. Then define $\operatorname{kerd}_{f}=$ $\left\{x \in X / d_{f}(x)=0\right.$ for all f-derivations $\left.d_{f}\right\}$.
Proposition 6.6: Let $\mathrm{d}_{\mathrm{f}}$ be an f -derivation of a BCIK-algebra X . Then the following hold:

1. $\mathrm{d}_{\mathrm{f}}(\mathrm{x}) \leq \mathrm{f}(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{X}$;
2. $d_{f}(x) * f(y) \leq f(x) * d_{f}(y)$ for all $x, y \in X ;$
3. $\quad d_{f}(x * y)=d_{f}(x) * f(y) \leq d_{f}(x) * d_{f}(y)$ for all $x, y \in X$;
4. $\operatorname{kerd}_{f}$ is a sub algebra of $X$. Especially, if $f$ is monic, then $\operatorname{kerd}_{f} \subseteq \mathrm{X}_{+}$.

## Proof.

1. The proof follows by Proposition 5.10(2).
2. Since $d_{f}(x) \leq f(x)$ for all $x \in X$, then $d_{f}(x) * f(y) \leq f(x)$ * $f(y) \leq f(x) * d_{f}(y)$.
3. For any $x, y \in X$, we have
$\mathrm{d}_{\mathrm{f}}(\mathrm{x} * \mathrm{y})=\left(\mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right) \wedge\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right)$
$\left.=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right) *\left(\left(\mathrm{~d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right)^{*} \mathrm{f}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})\right)\right)$
$=\left(\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y})\right) * 0=\mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{f}(\mathrm{y}) \leq \mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})$,
Which proves (3).
4. Let $\mathrm{x}, \mathrm{y} \in \operatorname{kerd}_{\mathrm{f}}$, then $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=0=\mathrm{d}_{\mathrm{f}}(\mathrm{y})$, and so $\mathrm{d}_{\mathrm{f}}(\mathrm{x} * \mathrm{y})$ $\leq \mathrm{d}_{\mathrm{f}}(\mathrm{x}) * \mathrm{~d}_{\mathrm{f}}(\mathrm{y})=0 * 0=0$ by (3),
and thus $\mathrm{d}_{\mathrm{f}}(\mathrm{x} * \mathrm{y})=0$, that is, $\mathrm{x} * \mathrm{y} \in \operatorname{kerd}_{\mathrm{f}}$, then $0=\mathrm{d}_{\mathrm{f}}(\mathrm{x}) \leq$ $\mathrm{f}(\mathrm{x})$ by (1), and so $\mathrm{f}(\mathrm{x}) \in \mathrm{X}_{+}$,
that is, $0 * f(x)=0$, and thus $f(0 * x)=f(x)$, which that $0 * x=$ $x$, and so $x \in X_{+}$, that is,
$\operatorname{kerd}_{f} \subseteq \mathrm{X}_{+}$.
Theorem 6.7: Let be monic of a commutative BCIK-algebra $X$. Then $X$ is $p$-semi simple if and only if
$\operatorname{kerd}_{f}=\{0\}$ for every regular $f$-derivation $d_{f}$ of $X$.

## Proof.

Assume that X is p -semi simple BCIK-algebra and let $\mathrm{d}_{\mathrm{f}}$ be a regular f-derivation of $X$. Then $X_{+}=\{0\}$, and
So $\operatorname{kerd}_{f}=\{0\}$ by using Proposition 6.6(4), Conversely, let $\operatorname{kerd}_{f}=\{0\}$ for every regular $f$-derivation $d_{f}$ of $X$. Define a selfmap $d_{f}$ of $X$ by $d^{*} f(0)=f_{x}$ for all $x \in X$. Using Theorem 5.9, $d_{f}^{*}$ is an f-derivation of X. Clearly, $\mathrm{d}_{\mathrm{f}}^{*}(0)=\mathrm{f}_{0}=0 *(0 * f(0))=0$, and so $d_{f}^{*}$ is a regular $f$-derivation of $X$. It follows from the hypothesis that ker $d^{*}{ }_{f}=\{0\}$. In addition, $d_{f}^{*}(x)=f_{x}=0 *(0 *$ $\mathrm{f}(\mathrm{x}))=\mathrm{f}\left(0^{*}\left(0^{*} \mathrm{x}\right)\right)=\mathrm{f}(0)=0$ for all $\mathrm{x} \in \mathrm{X}_{+}$, and thus $\mathrm{x} \in$ ker $\mathrm{d}_{\mathrm{f}}$. Hence, by Proposition 6.6(4), $\mathrm{X}_{+} \in$ ker $\mathrm{d}_{\mathrm{f}}^{*}=\{0\}$. Therefore, $X$ is $p$-semi simple.
Definition 6.8: An ideal $A$ of a BCIK-algebra $X$ is said to be an f-ideal if $f(A) \subseteq A$.

Definition 6.9: Let $\mathrm{d}_{\mathrm{f}}$ be a self-map of a BCIK-algebra X. An fideal $A$ of $X$ is said to be $d_{f}$-invariant if
$\mathrm{d}_{\mathrm{f}}(\mathrm{a}) \subseteq \mathrm{A}$.
Theorem 6.10: Let $d_{f}$ be a regular ( $\mathrm{r}, \mathrm{l}$ )-f-derivation of a BCIK-algebra $X$, then every f-ideal $A$ of $X$ is
$\mathrm{d}_{\mathrm{f}}(\mathrm{A}) \subseteq \mathrm{A}$.
Theorem 6.11: Let $\mathrm{d}_{\mathrm{f}}$ be a regular ( $\mathrm{r}, \mathrm{l}$ )-f-derivation of a BCIK-algebra X , then every f-ideal A of X is
$\mathrm{d}_{\mathrm{f}}$-invariant.

## Proof.

By Proposition 6.10(2), we have $\mathrm{d}_{\mathrm{f}}(\mathrm{x})=\mathrm{f}(\mathrm{x}) \wedge \mathrm{d}_{\mathrm{f}}(\mathrm{x}) \leq \mathrm{f}(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{X}$. Let $\mathrm{y} \in \mathrm{d}_{\mathrm{f}}(\mathrm{A})$. Let $\mathrm{y} \in \mathrm{d}_{\mathrm{f}}(\mathrm{A})$.
Then $y=d_{f}(x)$ for some $x \in A$. It follows that $y * f(x)=d_{f}(x)$ * $f(x)=0 \in A$. Since $x \in A$, then
$f(x) € f(A) \subseteq A$ as $A$ is an f-ideal. It follows that $y \in A$ since $A$ is an ideal of $X$. Hence $d_{f}(A) \subseteq A$,
and thus $A$ is $d_{f}$ - invariant.
Theorem 6.12: Let $\mathrm{d}_{\mathrm{f}}$ be an f -derivation of a BCIK-algebra X . Then $d_{f}$ is regular if and only if every $f$-ideal of $X$ is $d_{f}{ }^{-}$ invariant.

Proof. Let $\mathrm{d}_{\mathrm{f}}$ be a derivation of a BCIK-algebra X and assume that every f-ideal of $X$ is $d_{f}$-invariant. Then
Since the zero ideal $\{0\}$ is $f$-ideal and $d_{f}$-invariant, we have $d_{f}$ $(\{0\}) \subseteq\{0\}$, which implies that $\mathrm{d}_{\mathrm{f}}(0)=0$.

International Journal of Trend in Scientific Research and Development (IJTSRD) @ www.ijtsrd.com eISSN: 2456-6470

Thus $\mathrm{d}_{\mathrm{f}}$ is regular. Combining this and Theorem 6.10, we complete the proof.

## 7. Regularity of generalized derivations

To develop our main results, the following:
Definition 7.1: [8]. Let $\theta$ and $\phi$ be two endomorphisms of $X$. A self-map $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right): \mathrm{X} \rightarrow \mathrm{X}$ is called

1. An inside $(\theta, \phi)$-derivation of
$\left.(\forall \mathrm{x}, \mathrm{y} \in \mathrm{X})\left(\mathrm{d}_{( } \theta, \phi\right)\left(\mathrm{x}^{*} \mathrm{y}\right)=\left(\mathrm{d}_{( } \theta, \phi\right)(\mathrm{x})^{*} \theta(\mathrm{y})\right) \wedge\left(\phi(\mathrm{x})^{*}\right.$ $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{\mathrm{J}}(\mathrm{y}) \mathrm{f}\right)$,
2. An outside $\left({ }^{\theta}, \phi^{\phi}\right)$-derivation of $X$ if it satisfies: $(\forall \mathrm{x}, \mathrm{y} \in \mathrm{X})\left(\mathrm{d}(\theta, \phi)(\mathrm{x} * \mathrm{y})=\left(\left(\phi(\mathrm{x})^{*} \mathrm{~d}_{( } \theta, \phi\right)\right.\right.$ $\left.(\mathrm{y})) \wedge\left(\mathrm{d}_{( } \theta, \phi\right)(\mathrm{x})^{*} \theta(\mathrm{y})\right)$,
3. A $(\theta, \phi)$-derivation of X if it is both inside $(\theta, \phi)$ derivation and an outside ( $\theta, \phi$ )-derivation.

Example 7.2: [8]. Consider a BCIK- algebra $\mathrm{X}=\{0, \mathrm{a}, \mathrm{b}\}$ with the following Cayley table:

| $*$ | 0 | a | b |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | b |
| a | a | 0 | b |
| b | b | b | 0 |

Define a map
$\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}: \mathrm{X} \rightarrow \mathrm{X}, \mathrm{x} \mapsto\left\{\begin{array}{c}\text { bif } x \in\{0, a\}, \\ 0 \text { if } x=b,\end{array}\right.$
and define two endomorphisms
$\theta: \mathrm{X} \rightarrow \mathrm{X}, \mathrm{x} \mapsto\left\{\begin{array}{c}0 \text { if } x \in\{0, a\}, \\ b \text { if } x=b,\end{array}\right.$
And $\phi: \mathrm{X} \rightarrow \mathrm{X}$ such that $\theta(\mathrm{x})=\mathrm{x}$ for all $\mathrm{x} \in \mathrm{X}$.
It is routine to verify that $\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}$is both an inside $(\theta, \phi)$ derivation and an outside ( $\theta, \phi$ )-derivation of X .

Lemma 7.3: [8]. For any outside $(\theta, \phi)$-derivationd $(\theta, \phi)$ of a BCIK-algebra X , the following are equivalent:

1. $(\forall \mathrm{x} \in \mathrm{X})\left(\mathrm{d}_{( } \theta, \phi_{)}(\mathrm{x})=\theta(\mathrm{x}) \wedge \mathrm{d}_{( } \theta, \phi_{)}(\mathrm{x})\right)$
2. $\left.\mathrm{d}_{( } \theta, \phi\right)(0)=0$.

Definition 7.4: Let $\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}: \mathrm{X} \rightarrow \mathrm{X}$ be an inside (or out side) $(\theta, \phi)$-derivation of a BCIK-algebra X . Then $\mathrm{d}_{( } \theta, \phi$ ) is said to be regular if $\mathrm{d}_{( } \theta, \phi_{)}(0)=0$.

Example 7.5: The inside (or outside) ( $\theta, \phi$ )-derivationd ( $\theta, \phi$ ) of $X$ in Example 7.2. is not regular.

Proposition 7.6: Let $\left.\mathrm{d}_{( } \theta, \phi\right)$ be a regular outside $\left.\theta, \phi\right)$ derivation of a BCIK-algebra X. Then

1. Both $\theta(\mathrm{x})$ and $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right)(\mathrm{x})$ belong to the same branch for all $x \in X$.
2. $(\forall \mathrm{x} \in \mathrm{X})\left(\mathrm{d}_{( } \theta, \phi\right)(\mathrm{x} \leq \theta(\mathrm{x}))$.
3. $(\forall \mathrm{x}, \mathrm{y} \in \mathrm{X})\left(\mathrm{d}_{( } \theta, \phi_{)}(\mathrm{x}) * \theta(\mathrm{y}) \leq \theta(\mathrm{x}) * \mathrm{~d}_{( } \theta, \phi_{)}(\mathrm{y})\right)$.

Proof.

1. For any $x \in X$, we get
$0=\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}=\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}\left(\mathrm{a}_{\mathrm{x}} * \mathrm{x}\right)$
$=\left(\theta\left(\mathrm{a}_{\mathrm{x}}\right)^{*} \mathrm{~d}_{( } \theta, \phi_{)}(\mathrm{x})\right) \wedge\left(\left(\mathrm{d}_{( } \theta, \phi_{)}\left(\mathrm{a}_{\mathrm{x}}\right)^{*} \phi(\mathrm{x})\right)\right.$
$=\left(\left(\mathrm{d}_{( } \boldsymbol{\theta}, \phi\right)\left(\mathrm{a}_{\mathrm{x}}\right)^{*} \phi(\mathrm{x})\right)^{*}\left(\left(\mathrm{~d}_{( } \boldsymbol{\theta}, \phi\right)\left(\mathrm{a}_{\mathrm{x}}\right)^{*} \phi(\mathrm{x})\right)^{*}\left(\boldsymbol{\theta}\left(\mathrm{a}_{\mathrm{x}}\right)^{*}\right.$ $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}(\mathrm{x})\right)$

Since $\theta\left(\mathrm{a}_{\mathrm{x}}\right)^{*} \mathrm{~d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}(\mathrm{x}) \in \mathrm{L}_{\mathrm{p}}(\mathrm{X})$. Hence $\theta\left(\mathrm{a}_{\mathrm{x}}\right) \leq \mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}(\mathrm{x})$, and so $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)} \in \mathrm{V}\left(\boldsymbol{\theta}\left(\mathrm{a}_{\mathrm{x}}\right)\right)$.
2. Since $\mathrm{d}_{( } \theta, \phi_{)}$is regular, $\mathrm{d}_{( } \theta, \phi_{)}=0$. It follows from Lemma 7.3. that
$\left.\mathrm{d}_{( } \theta, \phi_{)}(\mathrm{x})=\theta(\mathrm{x}) \wedge \mathrm{d}_{( } \theta, \phi\right)(\mathrm{x}) \leq \theta(\mathrm{x})$.
3. Since $\left.\mathrm{d}_{( } \theta, \phi\right)(\mathrm{x}) \leq \theta(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{X}$, we have $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}(\mathrm{x})^{*} \boldsymbol{\theta}(\mathrm{y}) \leq \boldsymbol{\theta}(\mathrm{x})^{*} \boldsymbol{\theta}(\mathrm{y}) \leq \boldsymbol{\theta}(\mathrm{x})^{*} \mathrm{~d}_{( } \boldsymbol{\theta}, \phi\right)(\mathrm{y})$

If we take $\theta=\phi=f$ in proposition 7.6 , then we have the following corollary.
Corollary 7.7: [6]. If $\mathrm{d}_{\mathrm{f}}$ is a regular ( $\left.\mathrm{r}, \mathrm{l}\right)$ - f -derivation of a BCIK-algebra X , then both $\mathrm{f}(\mathrm{x})$ and $\mathrm{d}_{\mathrm{f}}(\mathrm{x})$ belong to the same branch for allx $\in \mathrm{X}$.
Now we provide conditions for an inside (or outside)
$(\theta, \phi)$-derivation to be regular.
Theorem 7.8: Let $\mathrm{d}_{( } \theta, \phi$ ) be an inside $(\theta, \phi)$-derivationof a BCIK-algebra $X$. If there exists $a \in X$ such that $\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}(\mathrm{x}) * \theta(\mathrm{a})=0$ for all $\mathrm{x} \in \mathrm{X}$, then $\mathrm{d}_{( } \boldsymbol{\theta}, \phi$ ) is regular.

Proof. Assume that there exists $\mathrm{a} \in \mathrm{X}$ such that $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right)(\mathrm{x})^{*}$ $\theta(\mathrm{a})=0$ for all $\mathrm{x} \in \mathrm{X}$. Then
$\left.0=\mathrm{d}_{( } \theta, \phi_{)}\left(\mathrm{x}^{*} \mathrm{a}\right)=\left(\left(\mathrm{d}_{( } \theta, \phi_{)}(\mathrm{x})^{*} \theta(\mathrm{a})\right) \wedge \phi(\mathrm{x})^{*} \mathrm{~d}_{( } \theta, \phi_{)}(\mathrm{a})\right)\right)^{*} \mathrm{a}$ $=\left(0 \wedge\left(\phi(\mathrm{x}) * \mathrm{~d}_{( } \theta, \phi\right)(\mathrm{a})\right)^{*} \mathrm{a}=0 * \mathrm{a}$,

And so $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right)(0)=\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}\left(0{ }^{*} \mathrm{x}\right)=\left(\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}(0) * \boldsymbol{\theta}(\mathrm{a})\right)=$ 0 . Hence $\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}$is regular.

Theorem 7.9: If Xis a BCIK-algebra, then every inside (or outside) $(\theta, \phi)$-derivation of X is regular.

Proof. Let $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}$ ) be an inside ( $\boldsymbol{\theta}, \boldsymbol{\phi}$ ) -derivation of a BCIKalgebra. Then
$\left.\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right)(0)=\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right)(0 * \mathrm{x})$
$=\left(\mathrm{d}_{( } \theta, \phi_{)}(0) * \theta(\mathrm{x})\right) \wedge\left(\phi(0) \wedge \mathrm{d}_{( } \theta, \phi_{)}(\mathrm{x})\right)$
$\left.=\left(\mathrm{d}_{( } \theta, \phi\right)(0) * \theta(\mathrm{x})\right) \wedge 0=0$.
If $\left.\mathrm{d}_{( } \theta, \phi\right)$ is an outside $(\theta, \phi)$-derivation of a BCIK—algebra X , then
$\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right)(0)=\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}(0 * \mathrm{x})$
$=\left(\theta(0) * \mathrm{~d}_{( } \theta, \phi_{)}(\mathrm{x})\right) \wedge\left(\mathrm{d}_{( } \theta, \phi_{)}(0) * \theta(\mathrm{x})\right)$
$=0 \wedge\left(\mathrm{~d}_{( } \theta, \phi_{)}(0) * \theta(\mathrm{x})\right)=0$.
Hence $\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{\mathrm{J}}$ is regular.
To prove our results, we define the following notions:
Definition 7.10: For an inside (or outside) ( $\theta, \phi$ )derivationd $(\boldsymbol{\theta}, \boldsymbol{\phi})$ of a BCIK-algebra X , we say that an ideal A
of $X$, we say that an ideal $A$ of $X$ is a $\theta$-ideal (resp. $\phi$-ideal) if $\theta(\mathrm{A}) \subseteq \mathrm{A}($ resp. $\phi(\mathrm{A}) \subseteq \mathrm{A})$.

Definition 7.11: For an inside (or outside) ( $\theta, \phi$ )derivationd $\left(\boldsymbol{\theta}, \boldsymbol{\phi}_{)}\right.$of a BCIK-algebra X , we say that an ideal A of $X$, we say that an ideal $A$ of $X$ is $d_{( } \theta, \phi_{)}$-invariant if $\left.\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}\right) \subseteq \mathrm{A}$.

Example 7.12: Let $\mathrm{d}_{( } \theta, \phi$ ) be an outside ( $\theta, \phi$ )-derivation ofX which is described Example 7.2. we know that $A:=\{0, a\}$ is both a $\theta$-ideal and $\phi$-ideal of X . But $\mathrm{A}:=\{0, \mathrm{a}\}$ is an ideal of X which is not $\mathrm{d}_{( } \theta, \phi_{)}$-invariant.

Theorem 7.13: Let $\mathrm{d}_{( } \theta, \phi$ ) be a outside $(\theta, \phi)$-derivation of a BCIK-algebra X . Then every $\boldsymbol{\theta}$-ideal of X is $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)^{-}}$ invariant.
Proof. Let A be a $\theta$-ideal of X . Since $\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}$is regular, it follows from Lemma 7.3 that $\left.\left.\mathrm{d}_{( } \theta, \phi\right)=\theta(\mathrm{x}) \wedge \mathrm{d}_{( } \theta, \phi\right)$ $(\mathrm{x}) \leq \boldsymbol{\theta}(\mathrm{x})$ for all $\mathrm{x} \in \mathrm{X}$. Let $\mathrm{y} \in \mathrm{X}$ be such that $\left.\mathrm{y} \in \mathrm{d}_{( } \theta, \phi\right)(\mathrm{A})$. Then $\mathrm{y}=\mathrm{d}_{( } \theta, \phi_{)}(\mathrm{x})$ for some $\mathrm{x} \in \mathrm{A}$. Thus $\mathrm{y} * \boldsymbol{\theta}(\mathrm{x})=$ $\left.\mathrm{d}_{( } \theta, \phi\right)(\mathrm{x}) * \theta(\mathrm{x})=0 \in \mathrm{~A}$.

Note that $\theta(\mathrm{x}) \in \theta(\mathrm{A}) \subseteq \mathrm{A}$. Since A is an ideal of X , it follows that $\mathrm{y} \in \mathrm{A}$ so that $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}(\mathrm{A}) \subseteq \mathrm{A}$. Therefore A is $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)^{-}}$ invariant.
If we take $\theta=\phi=1_{\mathrm{x}}$ in Theorem 7.13. $1_{\mathrm{x}}$ is the identity map, then we have the following corollary.
Corollary 7.14: [4]. Let $d$ be a regular ( $\mathrm{r}, \mathrm{l}$ )-derivation of a BCIK-algebra X . Then every ideal of X is d -invariant.
If we take $\theta=\phi=\mathrm{f}$ in Theorem 3.13, then we have the following corollary.
Corollary 7.15: [6]. Let $\mathrm{d}_{\mathrm{f}}$ be a regular ( $\mathrm{r}, \mathrm{l}$ )-f-derivation of a BCIK-algebra X . Then every f-ideal of X is $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}$-invariant.

Theorem 7.16: Let $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}$ ) be an outside $(\theta, \phi)$-derivation of a BCIK-algebra X . If every $\boldsymbol{\theta}$-ideal of X is $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)^{-}}$ invariant, then $\mathrm{d}_{( } \theta, \phi_{)}$is regular.

Proof. Assume that every $\theta$-ideal of X is $\mathrm{d}_{( } \boldsymbol{\theta}, \phi_{)}$-invariant. Since the zero ideal $\{0\}$ is clearly $\theta$-ideal and $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)^{-}}$ invariant, we have $\mathrm{d}_{( } \theta, \phi_{)}(\{0\}) \subseteq\{0\}$, and so
$\left.\mathrm{d}_{( } \theta, \phi\right)=0$. Hence $\mathrm{d}_{( } \theta, \phi_{)}$is regular.
Combining Theorem 7.13. and 7.16., we have a characterization of a regular outside $(\theta, \phi)$-derivation.

Theorem 7.17: For an outside $(\theta, \phi)$-derivationd $(\theta, \phi)$ of a BCIK-algebra X , the following are equivalent:

1. $\left.\mathrm{d}_{( } \theta, \phi\right)$ is regular.
2. Every $\boldsymbol{\theta}$-ideal of X is $\mathrm{d}_{( } \boldsymbol{\theta}, \boldsymbol{\phi}_{)}$-invariant.

If we take $\theta=\phi=1_{\mathrm{x}}$ in Theorem 3.17. where $1_{\mathrm{x}}$ is the identity map, then we have the following corollary.
Corollary 7.18: [4]. Let $d$ be an ( $\mathrm{r}, \mathrm{l}$ )-derivation of a BCIKalgebra X . Then d is regular if and only if every ideal of X is d invariant.

If we take $\theta=\phi=\mathrm{f}$ in Theorem 3.17, then we have the following corollary.
Corollary 7.19: [6]. For an ( $\mathrm{r}, \mathrm{l}$ )-f-derivation $\mathrm{d}_{\mathrm{f}}$ of a BCIKalgebra X , the following are equivalent:

1. $d_{f}$ is regular.
2. Every f-ideal of X is $\mathrm{d}_{\mathrm{f}}$-invarient.

## CONCULUTION

In this present paper, we have consider the notions of regular inside (or outside) $(\theta, \phi)$-derivation, $\theta$-ideal, $\phi$ ideal and invariant inside (or outside) ( $\theta, \phi$ )-derivation of a BCIK-algebra, and investigated related properties. The theory of derivations of algebraic structures is a direct descendant of the development of classical Galosis theory. In our opinion, these definitions and main results can be similarly extended to some other algebraic system such as subtraction algebras, B -algebras, MV-algebras, d -algebras, Q algebras and so forth.
In our future study the notion of regular $(\theta, \phi)$-derivation on various algebraic structures which may have a lot applications $(\theta, \phi)$-derivation BCIK-algebra, may be the following topics should be considered:

1. To find the generalized $(\boldsymbol{\theta}, \boldsymbol{\phi})$-derivation of BCIKalgebra,
2. To find more result in $(\boldsymbol{\theta}, \boldsymbol{\phi})$-derivation of BCIK-algebra and its applications,
3. To find the $(\boldsymbol{\theta}, \boldsymbol{\phi})$-derivation of B -algebras, Q -algebras, subtraction algebras, d-algebra and so forth.

## Acknowledgment

The author would like to thank Editor-in-Chief and referees for the valuable suggestions and corrections for the improvement of this paper.
