#### Abstract

BACK GROUND: The present study aim to effectiveness of Amla Juice with Honey to reduce the blood pressure level among hypertensive patients in selected urban area. METHODS AND MATERIALS: The quantitative approach with One group pretest posttest experimental research design was used for the present study. A total 100 samples were collected using non probability purposive sampling technique. The demographic data and clinical variables were gathered using self-administered questionnaire, followed by that data was gathered and analyzed. RESULTS: In the pretest, 37(37\%) had systolic BP less than $120 \mathrm{mmHg}, 31(31 \%)$ had 121 - 139, $28(28 \%)$ had $141-159 \mathrm{mmHg}$ and $4(4 \%)$ had $\geq 160 \mathrm{mmHg}$ of systolic BP whereas in the post-test, $62(62 \%)$ had less than 120 mmHg and $38(38 \%)$ had $121-139 \mathrm{mmHg}$ of systolic BP.37(27\%) had diastolic BP less than $80 \mathrm{mmHg}, 30(30 \%)$ had $80-89 \mathrm{mmHg}$, $26(26 \%)$ had $90-99 \mathrm{mmHg}$ and $7(7 \%) \mathrm{had} \geq 100 \mathrm{mmHg}$ of diastolic BP whereas in the post-test, $57(57 \%)$ had less than 80 mmHg and $43(43 \%)$ had $80-89 \mathrm{mmHg}$ of diastolic BP. CONCLUSION: Thus, the present despites that reduce the blood pressure level among hypertensive patients.

KEYWORDS: Hypertension, Amla juice, Honey, Blood Pressure Level

## INTRODUCTION

Hypertension is a condition in which blood pressure is abnormally high when the average of at least two accurate blood pressure measurements obtained at least twice in two visits is equal to or higher than 140 mmHg for the systolic blood pressure (SBP) and/or 90 mmHg for the diastolic blood pressure (DBP), the condition is known as hypertension. [1]
More than 41 million people worldwide pass away each year from non-communicable diseases (NCDs), accounting for $71 \%$ of all fatalities. Of the 15 million people who pass away between the ages of 30 and 70 , many of them do so prematurely. [2]Untreated hypertension is one of the major issues in developing nations since it can result in serious and perhaps fatal illnesses. According to the statistics data, hypertension is thought to be the cause of 7.5 million fatalities worldwide each year, but the actual number
is closer to $12.8 \%$. Nearly $40 \%$ of people worldwide who are 25 years of age or older have hypertension; this is an increase from the 600 million cases reported in 1980 to roughly 1 billion cases reported in 2008 [3].The leading cause of preventable illnesses and deaths in India is hypertension. It is a significant contributor to the risk of cardiovascular disease, which contributed to $32 \%$ of adult fatalities and $23 \%$ of all deaths between 2010 and 2013. In order to achieve the Sustainable Development Goals (SDG) aim of lowering premature mortality from noncommunicable diseases (NCDs) by one-third by 2030, India has pledged to implement a number of initiatives [4].HTN is the most prevalent noncommunicable disease in the majority of African nations, and in Cameroon in particular[5].According to various evaluations, the prevalence of HTN in the

Middle East and eastern Mediterranean countries ranged from 17 to $39 \%$, and recent social and economic changes in these regions contributed to the high prevalence of the condition [6].One of the main causes of the rising prevalence of hypertension in India is a lack of awareness. Many people are unaware of their hypertension condition, and in some cases the cause of death is still unknown because most people with hypertension remain healthy and are only identified when cardiovascular disease or a stroke manifests. According to the estimate of the global burden of diseases from 2015, hypertension is one of the leading causes of death[7].Both urban and rural populations are now more likely to have HTN. In India, the prevalence of hypertension has increased over the past 60 years from $2 \%$ to $25 \%$ in urban areas and from $2 \%$ to $15 \%$ in rural areas. [8]
This includes weight loss by food intervention, quitting smoking, and engaging in physical activity. Comprehensive hypertension care should prioritise lowering cardiovascular risk as well as blood pressure through lifestyle changes, cholesterol control, quitting smoking, and regular exercise. [9]
It is a silent killer since very few early symptoms are ever noticed before a serious medical emergency like a heart attack, stroke, or chronic renal disease occurs. Only through measures may elevated blood pressure be found since people are not aware of it. Although the majority of hypertension patients experience no symptoms, some HTN sufferers report headaches, dizziness, vertigo, blurred vision, or fainting episodes. [10]
Thiazide diuretics and beta blockers are examples of medications used to treat high blood pressure. ACE drugs, or angiotensin-converting enzyme inhibitors. Blockers of the angiotensin II receptor (ARBs) Blockers of calcium channels Vasodilators and Renin Inhibitors. This study supports non-pharmacological interventions for the management of high blood pressure, including weight loss, increased physical activity, moderate alcohol consumption, reduced salt intake, fish oil supplementation, behavioural techniques like meditation and yoga, herbal remedies, and garlic. Indian gooseberry, fish oil, and omega-3 fatty acids can lessen the effects of hypertension. The most popular herb in ayurveda is amla; it balances the three Doshas of vayu, pitta, and kapha, aids with cardiac and digestive issues, strengthens the immune system, enhances vision, provides a healthy glow to the skin and hair, and is a rich source of vitamin C.
[11] Its antibacterial, carminative, hypoglycemic, stomachine hypotensive, and astringent activity also controls hyperacidity and prevents infection, aids in ulcer healing, and treats jaundice, dyspepsia, and cough. Alma is a good cardio tonic, and its modest heart stimulating activity aids in blood pressure regulation. Gooseberry continues to be a widely used tonic. The fruit of the gooseberry contains $81.2 \%$ water, making it an excellent source of moisture for the skin. The highest natural source of vitamin C is found there. About 700 mg of vitamin C may be found in 100 g of amla, which is thirty times more than in an orange. Additionally, it contains tannic acids, calcium, iron, protein, carbs, sugar, and phosphorus. [12]

## MATERIAL AND METHODS:

Study design: The quantitative approach with one group pre-test post-test experimental design was designed to investigate the effectiveness of Amla Juice with Honey to reduce the blood pressure level among hypertensive patients in selected urban area.
Study Setting: This study was conducted for 1 month from $1^{\text {st }}$ March 2022 till $30^{\text {th }}$ march 2022 in the Nerkundram.

Ethical Approval: After obtaining ethical clearance from the Institutional Ethical Committee (IEC) of Urban Primary Health Centre(UPHC) and formal permission from the medical officer the main study was conducted.

Study participants: A total 100 reproductive women aged between 40 to 60 years identify the hypertensive patients. The inclusion criteria for the study, Clients with hypertension who are willing to participate, Clients who are in the age group of 40 to 60 years of age, Clients who are having hypertension above $140 / 90 \mathrm{mmHg}$, Clients with hypertension who had no other co morbidities, exclusion criteria for the study are, Clients with hypertension not willing to participate in the study, Clients with hypertension with other comorbid conditions were excluded,Clients who are sensitivity to amla juice, Clients who are having hypertension above $180 / 110 \mathrm{mmHg}$.
Sampling Technique: A total of 100 hypertensive patients were recruited based on the inclusion criteria by using convenience sampling technique.
Informed Consent: The purpose of the study was explained by the investigator to each of the study participants and a written informed consent was obtained from them.

## RESULTS AND DICUSSION <br> DESCRIPTION OF THE DEMOGRAPHIC VARIABLES OF THE CLIENTS WITH HYPERTENSION

Table 1: Frequency and percentage distribution of demographic variables of clients with hypertension $\mathrm{n}=100$

| Demographic Variables | F | \% |
| :---: | :---: | :---: |
| Age in years |  |  |
| 26-35 | 29 | 29.0 |
| 36-45 | 33 | 33.0 |

Percentage distribution of area of residence of the clients with hypertension

## ASSESSMENT OF BLOOD PRESSURE AMONG CLIENTS WITH HYPERTENSION

Table 2: Frequency and percentage distribution of pretest and post-test level of systolic BP among clients with hypertension
$\mathrm{n}=100$

| Systolic BP | Pretest |  | Post-test |  |
| :---: | :---: | :---: | :---: | :---: |
|  | F | $\%$ | F | $\%$ |
| Less than 120 mmHg | 37 | 37.0 | 62 | 62.0 |
| $121-139 \mathrm{mmHg}$ | 31 | 31.0 | 38 | 38.0 |
| $141-159 \mathrm{mmHg}$ | 28 | 28.0 | - | - |
| $\geq 160 \mathrm{mmHg}$ | 4 | 4.0 | - | - |

The above table shows that in the pretest, $37(37 \%)$ had systolic BP less than $120 \mathrm{mmHg}, 31(31 \%)$ had $121-$ $139,28(28 \%)$ had $141-159 \mathrm{mmHg}$ and $4(4 \%)$ had $\geq 160 \mathrm{mmHg}$ of systolic BP whereas in the post-test, $62(62 \%)$ had less than 120 mmHg and $38(38 \%)$ had $121-139 \mathrm{mmHg}$ of systolic BP.

Percentage distribution of pretest and post-test level of systolic BP among clients with hypertension
Table 3: Frequency and percentage distribution of pretest and post-test level of diastolic BP among clients with hypertension

| $\mathbf{n}$ | $\mathbf{1 0 0}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Diastolic BP   Pretest | Post-test |  |  |  |
|  | F | $\%$ | F | $\%$ |
| Less than 80 mmHg | 37 | 37.0 | 57 | 57.0 |
| $80-89 \mathrm{mmHg}$ | 30 | 30.0 | 43 | 43.0 |
| $90-99 \mathrm{mmHg}$ | 26 | 26.0 | - | - |
| $\geq 100 \mathrm{mmHg}$ | 7 | 7.0 | - | - |

The above table shows that in the pretest, $37(27 \%)$ had diastolic BP less than $80 \mathrm{mmHg}, 30(30 \%)$ had $80-89$ $\mathrm{mmHg}, 26(26 \%)$ had $90-99 \mathrm{mmHg}$ and $7(7 \%)$ had $\geq 100 \mathrm{mmHg}$ of diastolic BP whereas in the post-test, $57(57 \%)$ had less than 80 mmHg and $43(43 \%)$ had $80-89 \mathrm{mmHg}$ of diastolic BP.

Percentage distribution of pretest and post-test level of diastolic BP among clients with hypertension

## EFFECTIVENESS OF AMLA JUICE AND HONEY TO REDUCE THE BLOOD PRESSURE AMONG CLIENTS WITH HYPERTENSION

Table 4: Comparison of pretest and post-test level of blood pressure among clients with hypertension $\mathrm{n}=100$

| Variables | Pretest |  | Post-test |  | Mean Difference score | Paired 't' test \& p-value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mean | S.D | Mean | S.D |  | $\mathbf{1 3 . 1 0}$ |
| $\mathbf{t}=\mathbf{7 . 6 6 2} \mathbf{~ p = 0 . 0 0 0 1 , ~} \mathbf{S}^{* * *}$ |  |  |  |  |  |
| Systolic BP | 126.60 | 18.43 | 113.50 | 10.48 | $\mathbf{6 . 3 0}$ | $\mathbf{t = 5 . 0 9 6} \mathbf{~ p = 0 . 0 0 0 1 , ~} \mathbf{S}^{* * *}$ |
| Diastolic BP | 79.70 | 10.87 | 73.40 | 6.39 | $* *$ p $<0.001$, S - Significant |  |

The table 4 shows that the mean score of systolic BP was $126.60 \pm 18.43$ and the post-test mean score was $113.50 \pm 10.48$. The mean difference score was 13.10 . The mean score of diastolic BP was $79.70 \pm 10.87$ and the post-test mean score was $73.40 \pm 6$.39. the mean difference score was 6.30 . The calculated paired ' $\mathfrak{t}$ ' test value for systolic $\mathrm{BP}(\mathrm{t}=7.662)$ and diastolic $\mathrm{BP}(\mathrm{t}=5.096)$ was found to be statistically significant at $\mathrm{p}<0.001$ level which clearly infers that the administration of Amla juice with Honey among clients with hypertension was found to be effective in reducing the level of blood pressure in the post-test.

 significant association with post-test level of systolic BP among clients with hypertension at $\mathrm{p}<0.05$ level and the other demographic variables had not shown statistically significant association with post-test level of systolic BP among clients with hypertension.
The table 5 shows that the demographic variable area of educational status $2\left(\chi^{\mathbf{2}}=\mathbf{9 . 7 5 5}, \mathbf{p}=\mathbf{0 . 0 2 1}\right)$ had shown statistically significant association with post-test level of diastolic BP among clients with hypertension at p<0.05 level and the other demographic variables had not shown statistically significant association with post-test level of diastolic BP among clients with hypertension.

## CONCLUSION:

Therefore, it was concluded effectiveness of Amla Juice with Honey to reduce the blood pressure level among hypertensive patients in selected urban area. Based on statistical findings, it is evident that Amla Juice with Honey administration among the clients with hypertension was found to be more effective in reducing the level of blood pressure. So, In order to contain and reduce the hypetension among clients with hypertension the Amla Juice with Honeycan be administered at hospital setting to promote early recovery by the patients.
